CRYPTO TRADING CHALLENGE

From 10K to $100,000

Alan

Trader · Content Creator

@AlanTradingYT

The complete strategy, explained step by step. How I spot an entire crowd stuck on the wrong side of the market, and how I position myself early in the direction they will be forced to unwind.

+34.91R	44.4%	1.76	92
PERFORMANCE	WIN RATE	PROFIT FACTOR	TRADES

PART 1

The spirit of the challenge

Hey there, and welcome to this challenge.

The idea is simple: start from **$10,000** and try to reach **$100,000**, documenting **every trade**, winners and losers alike, in full transparency. No hidden results, no "I did a 10x overnight" without proof. You see everything: the entries, the exits, the screenshots, and above all the **reasoning** behind every decision.

Why this transparency? Because most of the trading content you see online only shows the wins. I want to show you the **reality** of a strategy: sometimes it loses, sometimes it wins, and it's **discipline over time** that makes the difference, not one lucky shot.

> *"The market doesn't reward the one who is right most often. It rewards the one who stays disciplined when he's wrong."*

🎯

A method

A clear, repeatable framework, not gut feeling trade by trade.

📓

A journal

Every trade logged, analyzed, graded. Data before ego.

🔍

Transparency

Losses displayed just as clearly as wins.

⚠️ **Important, right from the start:** this document tells the story of my first trades in an ongoing challenge. It's a sample **still being built**, not a statistical truth. You're going to learn a method and a way of thinking about the market, not a money-printing machine. Leveraged trading carries a **real risk of total loss**. Nothing here is investment advice.

PART 2

The philosophy

One single core idea, and everything flows from it.

My strategy rests on one principle: **hunt down an entire crowd stuck on the wrong side of the market, then position myself in the direction they will be forced to unwind.**

When too many traders bet in the same direction (for example a mass of sellers/shorts), they become **fuel**. If they're wrong, they all have to buy back in a panic at the same moment: that creates a violent acceleration, a **squeeze**. My job isn't to guess, it's to **read** four signals which, together, say that a crowd is trapped and that a precise target is waiting for it.

The key point that changed with experience: **I enter early, as soon as this profile is in place, without waiting for the explosion.** The final liquidation cascade isn't my entry signal, it's my **exit** signal: it's what propels the price all the way to my target. Waiting for it to enter would mean buying the top.

How a squeeze is born

1
Excess
A crowd piles up on the same side (crowd + funding)

→

2
The flow gives it away
The real orders (CVD) push the other way

→

3
Accumulation
Fresh money comes in (OI rising), the trap is loading

→

🔥
Squeeze
The trapped crowd unwinds in panic all the way to the target

TRAPPED CROWD → REAL FLOW → FRESH MONEY → CLEAR TARGET → I ENTER EARLY

The liquidation cascade isn't the starting line, it's the finish line.

In the pages that follow, we break down each of these pillars, then the way I combine them to grade my setups and manage my risk. Everything is designed to turn a *bet* into a *probability*.

PART 3

The 4 pillars

A real signal ticks four boxes. If even one is missing, I sit it out.

PILLAR 1 · THE FUEL

The crowd on the wrong side

The crowd AND the big players are on the wrong side (a mass of shorts when I want to buy). They're the ones who will have to buy back. Extreme funding is a clue to this excess, but on its own it often lies.

PILLAR 2 · THE REFEREE OF DIRECTION

The real flow (CVD)

CVD tells you who's really in control: buyers or sellers. Buyer CVD = the buyers are there, a true long. Without this flow in my direction, the rest is worthless.

PILLAR 3 · THE ACCUMULATION

Fresh money (OI)

Open Interest has to **rise**: new money is coming in, the trap is loading. Flat or melting OI = the crowd is quietly unwinding, no squeeze.

PILLAR 4 · THE TARGET

The ≥3R cluster

A clear pile of liquidations, at least **3 times further than my risk**. That's the price magnet. No real target = no trade, I never invent an objective out of thin air.

📍 **Why I enter early**

When the 4 boxes are ticked, the right moment is **now**, not after the explosion. I accept being wrong often (my win rate is below 50%). My edge isn't being right, it's that **my wins aim for at least 3 times my losses**.

One single target hit pays back several small stops.

PART 4

Setup classification

Not all setups are created equal. I grade them on three levels: the higher the grade, the more of the 4 boxes are ticked and the clearer the target.

A+

The perfect alignment

All 4 boxes ticked **and** a clear target at 3R or more. The holy grail: a massively trapped crowd, strong flow, exploding OI, a nearby cluster. Rare and lucrative.

A

The core of the strategy

All 4 boxes solid, target present, one notch below A+. My bread and butter, and by far the most profitable. This is where I trade most often.

B

The incomplete setup

One weak box: mixed flow (CVD), hesitant OI or a far-away target. The riskiest, often a loser. When I can, I stay out.

> 📌 **Remember:** the difference between A and B is NOT the trapped crowd, which is often identical. The difference is **the number of boxes truly ticked and the quality of the target**. A setup where the flow doesn't follow, or whose cluster is too far away, stays a B.

CRITERION	SETUP A+	SETUP A	SETUP B
Crowd on the wrong side	**Massive**	Clear	Present
Real flow (CVD)	**Strongly aligned**	Aligned	**Weak / mixed**
Fresh money (OI)	**Exploding**	Rising	Hesitant
Target (cluster)	**Clear, ≥3R**	Present, ≥3R	**Far away / fuzzy**
Risk level	Controlled	Controlled	High

PART 5

Risk management

If you only remember one part of this document, make it this one.

What blows up an account is never one single bad idea, it's bad risk management repeated over and over. The good news: it's the only part of trading you control 100%.

The "1R" principle

On every trade, I risk a fixed amount: **1R = about 1% of the capital**. No matter how confident I am, I never risk more. I think in R, not in dollars: it takes the emotion out of the amount.

The stop loss: sacred

My stop is set **before** I enter, and I never touch it to move it further away. The day you move your stop back "just this once" is the beginning of the end.

The dynamic Stop Profit

Once the trade is moving in the right direction, I gradually raise my stop under each new low (long) or above each new high (short) to lock in gains.

⚠️ **The lesson from trade #14:** one of my biggest wins (+5.43R) comes from a **sizing error**: wrong unit entered on mobile (USDT instead of tokens) → oversized position. I got lucky that the price went my way. If it had turned, that was -5R on a single trade. **Never replicate this: the fixed 1R stays sacred, even when the mistake pays off.** A positive result never validates a risk management error.

PART 6

Key lessons

Beyond the individual results, which patterns stand out after 92 trades?

🥇 The crowd, not the funding

THE major finding. The real fuel of a squeeze is an entire crowd stuck on the wrong side, not extreme funding. Funding alone often lies: on TNSR, it was at -0.82% (shorts supposedly trapped), but the sellers were right, a clean loss. **It's the crowd AND the big players on the wrong side that force the buyback. Pillar #1, non-negotiable.**

🥈 BTC is the boss of altcoins

Several trades failed not because of a bad setup, but because Bitcoin made a brutal move at the same moment. On low-caps, the impact is immediate. → Always check the BTC context before entering.

🥉 Stop placement is an art

A stop sitting in an obvious liquidity zone gets hunted, even when the thesis is right: on VELVET, the price grabbed the longs' stops RIGHT before exploding toward my target. → Place stops one notch beyond the "obvious" zones.

🏅 Manage on the right timeframe

Trade #13: analysis and entry on M5, but management on M1 → too much noise, premature exit at +0.24R while the move kept going. → Keep management on the entry timeframe (M5), not below.

💎 **I enter early, the ignition is for exiting, not entering.** When the 4 boxes are ticked, I enter on the setup as it's forming: waiting for the explosion (the liquidation cascade) means buying the top. That cascade is my EXIT signal, at the first cluster. The price reverses at the 1st cluster (APE, VELVET, RE), not the far one: I aim for 3R there, not some objective made up out of thin air.

PART 7

Disclaimer

The least fun part, but the most important one. If you're a beginner, read it twice.

> 🚨 **Leveraged trading can make you lose your entire capital, and faster than you imagine.** Everything you've seen uses leverage (5x, 10x). Leverage multiplies the gains, but it multiplies the losses in exactly the same way.

📊 **92 trades prove nothing statistically.** 44.4% win rate, profit factor 1.76, and losing streaks (up to 8 in a row). A single trade (#14) heavily inflates these numbers through accidental sizing. On such a small sample, luck plays a huge role. The strategy is promising and documented, not guaranteed.

🧠 **This document is educational, not a buy signal.** I'm sharing my method so you learn how to fish, not so you copy my trades blindly. Every trade you take remains your responsibility.

💸 **Never trade with money you need.** Trading capital is money you can afford to lose entirely, without it changing your life.

📜 **This is not investment advice.** I'm not your financial advisor. For decisions suited to your situation, consult a licensed professional.

> *"This is how a trader thinks, manages his risk, takes his losses and stays disciplined over time. The rest is yours to build."* 💪

PART 8

The dashboard

The state of the challenge after 92 trades. Everything is shown, the good and the not-so-good.

$10,000 STARTING CAPITAL	**$13,176.42** CURRENT CAPITAL	**+34.91R** PERFORMANCE
44.4% WIN RATE	**1.76** PROFIT FACTOR	**8.71%** MAX DRAWDOWN
+5.84R BEST TRADE	**-1.31R** WORST TRADE	**8** MAX LOSSES IN A ROW

INDICATOR	VALUE	READING
Win Rate	44.4%	A little under one trade in two
Profit Factor	1.76	$1.76 earned for every $1 lost over 92 trades
A / A+ setups	**+46.41R / +2.81R**	Confirmation entries carry the whole performance
B / B+ setups	-13.77R / -0.54R	Anticipation entries are still losing: to be tightened

⚠️ **The reminder that matters:** 92 trades is a small sample, and a single trade (#14, accidental sizing) heavily inflates these numbers. I've just been through a **streak of 8 losses in a row**, **broken by a +3.39R winner**: exactly the principle, one big winner wipes out the streak. Drawdown is part of the game, the strategy aims **big**. Don't take these numbers as a promise of performance, take them instead as the honest starting point of a journey we're documenting together.

PART 8 · CONTINUED

The capital curve

The real path of the account, trade by trade. That's the truth of trading: it goes through dips before climbing back up.

The dip, then the peak

The account dives to a low of $9,583, then the best trades, on confirmation, propel it to a peak of $13,502.

The recent drawdown

The worst streak reaches 8 losses in a row (max drawdown 8.71%). The account sits today at $13,176.42. On a small sample, you ride through the dips with a fixed risk.

💡 **The lesson of this curve:** on a small sample, the order of the trades creates an emotional roller coaster. That's why risk management (fixed 1R) and discipline are vital: they let you survive the dips until your statistical edge plays out.

07

The 92 trades, broken down

Every trade in detail: context, thesis, plan, result, post-trade review and the lesson learned, with the real screenshots. Green = winner, red = loser. Note: trades 1 to 12 are the original cards of the French journal (screenshots, numbers are universal); the full English write-ups start at trade 13.

#01 HOME LONG B

-1R PERTE

Anticipation avant confirmation · 06/06/2026 · Levier 10x

📊 Contexte

Funding Binance -0,79% · Bybit -1,18% · Predicted jusqu'à -4%

Open Interest +22% sur 24h, hausse régulière pendant toute la montée

💡 Thèse

Accumulation importante de shorts. Possibilité d'un short squeeze violent si cassure de la résistance majeure entre 0,063 et 0,067.

🎯 Plan

Entrée anticipée avant breakout, pour capturer l'accélération si le marché déclenche une chasse aux shorts.

ENTRÉE	SORTIE	STOP
0,057475	0,048518	0,048518

RISQUE
~115 USDT

🔍 Analyse post-trade

Le marché a rejeté fortement sous la résistance. La zone 0,063–0,067 n'a jamais été cassée. Le funding négatif et la hausse d'OI n'ont pas suffi à déclencher le squeeze attendu.

✅ Points forts

- Exécution correcte
- Gestion du risque respectée

⚠️ Points faibles

- Hypothèse incorrecte

LEÇON

Premier exemple réel d'une entrée B (anticipation breakout) sur un setup Funding négatif + hausse d'OI. Sans cassure validée, l'anticipation reste un pari.

#02 CLOU SHORT B -1R PERTE

Anticipation sur cassure de structure · 06/06/2026 · Levier 10x

📊 Contexte

Funding	Binance +0,1467% · Bybit +0,0441%
Open Interest	+62% sur 24h, nouveaux sommets d'OI pendant la montée

💡 Thèse

Accumulation importante de positions longues après une hausse de +24% et un double top (gros M en 5 min). Possibilité d'un flush des acheteurs tardifs après cassure de la neckline.

🎯 Plan

Entrée sur retest de la neckline, pour capturer l'accélération baissière si les acheteurs perdent le contrôle.

ENTRÉE	SORTIE	STOP
0,20261	0,21806	0,21794

RISQUE
~113 USDT

🔍 Analyse post-trade

La structure semblait favorable (OI fort, funding positif, double top, cassure neckline). Mais BTC a rebondi fortement au même moment, les acheteurs ont défendu la zone et la réintégration a invalidé l'idée baissière.

✅ Points forts

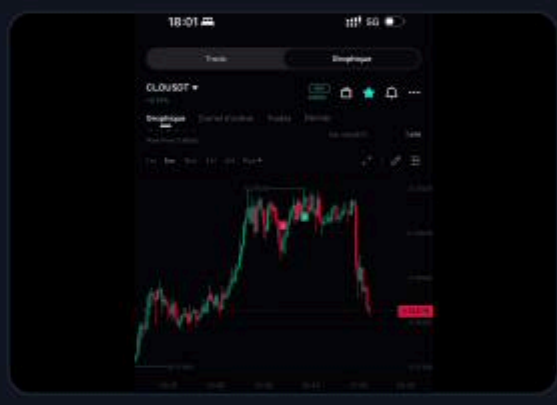

- Entrée proche du sommet
- Exécution disciplinée
- Stop respecté sans émotion

⚠️ Points faibles

- Cassure de structure seule insuffisante
- OI élevé ≠ liquidation automatique des longs
- Funding positif modéré ≠ extrême exploitable

LEÇON *Premier exemple d'un setup OI haussier + Funding positif + Double Top qui n'a pas produit la jambe baissière attendue. Attention au contexte BTC.*

#03 FIDA LONG A+ +1,81R GAIN

Alignement parfait · 07/06/2026 · Levier 10x

📊 Contexte

Funding Binance -0,78% · Bybit -1,14% · Predicted encore plus négatif

Open Interest +167% au signal — passé d'environ 3M à plus de 8M

💡 Thèse

Accumulation massive de shorts. Risque élevé de short squeeze violent si le prix valide une reprise haussière. Setup parfaitement aligné : Funding extrême + OI explosif + validation momentum.

🎯 Plan

Entrée sur confirmation. Quantité : 46 000 FIDA.

ENTRÉE	SORTIE	STOP
0,024429	0,028180	0,022281

RISQUE
97,76 USDT (1%)

🔍 Analyse post-trade

Scénario quasi parfait. Le prix a accéléré immédiatement, le short squeeze a propulsé FIDA au-dessus de 0,03$. Le trade a dépassé +3R latents. Stop Profit remonté progressivement (Break Even puis sous les nouvelles structures). Le funding s'étant normalisé et n'étant pas devant les écrans, sécurisation plus agressive. Le prix a ensuite fortement corrigé.

✅ Points forts

- Lecture parfaite du setup
- Entrée au bon moment
- Gestion du risque respectée
- Gestion dynamique du Stop Profit
- Sortie quand l'avantage statistique disparaissait

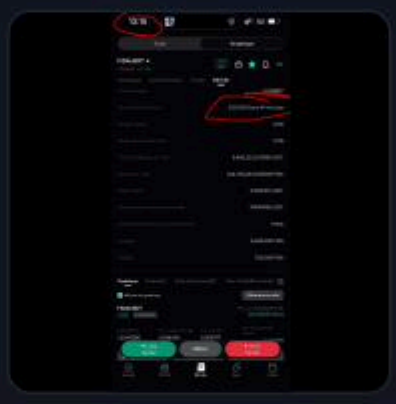

⚠️ Points faibles

- *Aucun point négatif majeur*

LEÇON *Quand les 3 piliers s'alignent ET que le prix confirme, c'est ÇA un A+. Une surveillance temps réel de l'OI/Predicted Funding aurait pu optimiser encore la sortie (+3R latents).*

#04 BEAT SHORT A +0,32R GAIN

Confirmation solide · 07/06/2026 · Levier 10x

📊 Contexte

Funding Binance +0,21% · Bybit +0,45% · OKX +0,15% · Predicted élevé

Open Interest Important et encore élevé malgré le début de la baisse

💡 Thèse

Excès de positions longues. Recherche d'un flush baissier après cassure de structure.

🎯 Plan

Entrée sur confirmation. Quantité : 440 BEAT.

ENTRÉE	SORTIE	STOP
2,1815	2,10489	2,4031

RISQUE
97,76 USDT (1%)

🔍 Analyse post-trade

Le scénario baissier s'est déclenché correctement, le prix a cassé les derniers plus bas. Stop déplacé à Break Even puis abaissé. Un violent rebond est venu toucher le Stop Profit avant que le prix ne réintègre la zone d'entrée. Trade terminé en gain malgré la volatilité.

✅ Points forts

- Lecture directionnelle correcte
- Setup conforme
- Gestion du risque respectée
- Protection active des gains

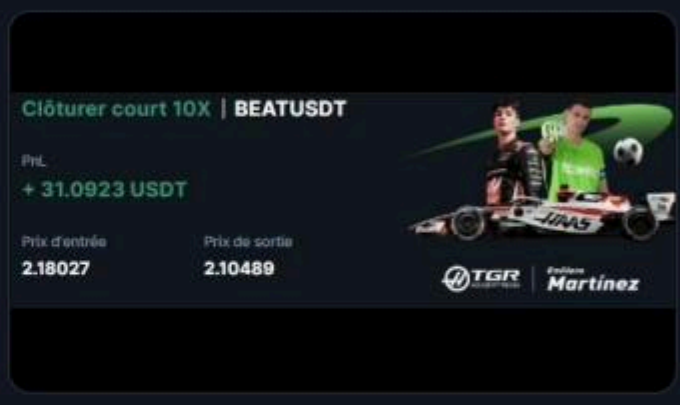

⚠️ Points faibles

- Sortie précoce qui réduit fortement le gain

LEÇON

Le trade avait dépassé +1R latent avant le retournement. La sortie précoce réduit le gain mais évite de rendre les profits au marché. Bonne discipline.

#05 GUN LONG A

-1R PERTE

Confirmation de breakout · 07/06/2026 · Levier 10x

📊 Contexte

Funding Binance -0,62% à -0,83% · Bybit -0,45% à -0,94% · Predicted -0,42% à -0,65%

Open Interest +24% sur 24h, proche de 4M à l'entrée, pas de baisse avant le déclenchement

💡 Thèse

Accumulation de shorts. Série de plus hauts/plus bas ascendants sous la résistance 0,00655. Short squeeze possible si cassure avec poursuite de la hausse d'OI.

🎯 Plan

Entrée sur cassure de la résistance, objectif au-dessus de 0,00655.

ENTRÉE	SORTIE	STOP
0,006569	0,006364	0,006389

RISQUE
~100 USDT

🔍 Analyse post-trade

Peu après l'entrée, BTC a subi une baisse rapide et brutale. GUN a cassé le support court terme et est venu chercher le stop et les liquidités sous la structure. Après le stop, le prix a vite réintégré la zone. L'OI n'a pas chuté, le funding est resté très négatif : la thèse n'a PAS été invalidée par les données dérivées.

✅ Points forts

- Lecture correcte du Funding
- Lecture correcte de l'OI
- Gestion du risque respectée
- Exécution conforme

⚠️ Points faibles

- Stop placé dans une zone de liquidité évidente
- Fort impact de BTC sur les altcoins low-cap

LEÇON

Premier cas d'un setup confirmé (A) dont l'échec semble causé par un mouvement EXTERNE (chute BTC) plutôt que par l'invalidation du setup. Placer les stops hors des zones de liquidité évidentes.

#06 GUN LONG B+ -1R PERTE

Anticipation à contexte exceptionnel · 08/06/2026 · Levier 10x

📊 Contexte

Funding Binance ~-0,62% · Bybit ~-0,45% · Predicted ~-0,56%

Open Interest +24% sur 24h, nouveaux plus hauts d'OI pendant que le prix restait bloqué sous la résistance

💡 Thèse

Accumulation importante de shorts. Short squeeze violent possible si cassure de la résistance autour de 0,00669. Setup encore valide malgré une 1re tentative stoppée quelques heures avant.

🎯 Plan

Entrée anticipée avant breakout, pour capturer le squeeze avant la cassure officielle.

ENTRÉE	SORTIE	STOP
0,006558	0,006291	0,006323

RISQUE
~110 USDT

🔍 Analyse post-trade

Le marché a effectué une chasse à la liquidité sous les derniers creux avant de repartir fortement. APRÈS le stop : cassure des résistances, dépassement des sommets, squeeze déclenché, +4,8% depuis l'entrée. L'hypothèse directionnelle était correcte, le marché avait juste besoin d'une respiration plus profonde.

✅ Points forts

- Hypothèse correcte
- Exécution correcte
- Gestion du risque respectée

⚠️ Points faibles

- Résultat financier négatif
- Trade stoppé avant validation complète

LEÇON *Deuxième cas GUN où le scénario s'est réalisé APRÈS le stop. Avoir raison ne suffit pas si on entre trop tôt — l'anticipation a chassé le stop avant le mouvement.*

#07 FIDA LONG B -0,5R PERTE

Anticipation avant confirmation · 08/06/2026 · Levier 10x

📊 Contexte

Funding Binance ~-1,24% — parmi les plus extrêmes du marché

Open Interest Forte hausse avant l'entrée, accumulation continue des vendeurs

💡 Thèse

Accumulation importante de shorts. Short squeeze violent possible si cassure des résistances entre 0,0319 et 0,0325.

🎯 Plan

Entrée anticipée avant breakout, pour profiter du financement négatif tout en capturant un éventuel squeeze.

ENTRÉE	SORTIE	STOP
0,028680	0,026563	0,026637

RISQUE
~100 USDT

🔍 Analyse post-trade

Le marché n'a jamais repris les résistances supérieures. Après plusieurs tentatives de rebond, le prix a perdu sa structure haussière et est venu chercher le stop. Le squeeze ne s'est jamais déclenché. MAIS le funding extrêmement négatif a fortement réduit la perte finale.

✅ Points forts

- Exécution correcte
- Gestion du risque respectée
- Funding exceptionnel ayant réduit la perte

⚠️ Points faibles

- Hypothèse incorrecte

LEÇON

Premier exemple où le funding compense environ la MOITIÉ de la perte théorique (-0,5R au lieu de -1R). Découverte clé : suivre séparément Performance Prix et Performance Funding.

#08 ESPORTS SHORT A -1R (net -1,24R) PERTE

Confirmation (M validé) · 08/06/2026 · Levier 10x

📊 Contexte

Funding	Très élevé
Open Interest le squeeze	+42% au 1er signal puis +117% après

💡 Thèse

Excès de longs après une longue tendance haussière. Premier M observé, cassure du point d'entrée validée. Stop au-dessus du dernier sommet.

🎯 Plan

Entrée sur confirmation de la cassure du M.

ENTRÉE	SORTIE	STOP
0,07219	0,08719	0,08719

RISQUE
~100 USDT

🔍 Analyse post-trade

La structure en M a été validée et le prix a d'abord réagi correctement. Puis les acheteurs ont déclenché un énorme short squeeze, invalidé le retournement et créé un nouveau sommet. Stop touché.

✅ Points forts

- Setup conforme
- OI anormalement élevé
- Funding extrême
- Structure technique présente
- Gestion du risque respectée
- Stop bien placé

⚠️ Points faibles

- Le M est probablement apparu trop tôt
- Le squeeze principal n'était pas terminé

LEÇON

Un premier M avec OI/Funding extrêmes ne marque pas forcément le top. Le marché peut créer un 1er M, attirer les shorts, déclencher un dernier squeeze, PUIS former le vrai sommet. Le -1,24R vient des frais/spread, pas d'un dépassement du risque.

#09 SIREN SHORT A +0,28R GAIN

Confirmation · 08/06/2026 · Levier 5x

📊 Contexte

Funding Fortement négatif attendu : Binance -0,429% · Bybit -0,079%

Open Interest À surveiller pendant la baisse du funding

💡 Thèse

Pression vendeuse dominante, structure baissière confirmée, momentum orienté à la baisse après l'entrée.

🎯 Plan

Entrée sur confirmation de la structure baissière. Levier réduit à x5.

ENTRÉE	SORTIE	STOP
1,22184	1,18135	~1,30

RISQUE
~100 USDT

🔍 Analyse post-trade

Trade bien exécuté, entrée cohérente avec le contexte. La sortie a été déclenchée par l'invalidation de la thèse (le funding est passé du côté des shorts, l'avantage statistique a disparu) plutôt que par le prix. Sortie manuelle, non émotionnelle.

✅ Points forts

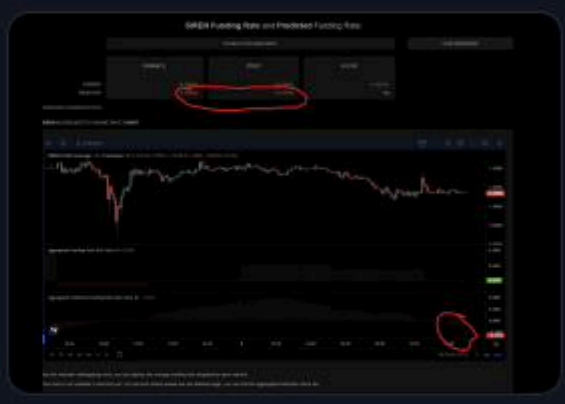

- Bonne lecture du contexte
- Sortie basée sur la data, pas l'émotion
- Exécution 8,5/10

⚠️ Points faibles

- *Aucun point négatif majeur*

LEÇON *Quand le Funding bascule du côté des shorts, le moteur principal du setup disparaît. Mieux vaut sécuriser les gains que rester exposé à un éventuel squeeze.*

#10 STG LONG A +0,42R GAIN

Confirmation (W de retournement) · 08/06/2026 · Levier 10x

📊 Contexte

Funding	Négatif (~-0,10%)
Open Interest	+30%, en reprise après la correction

💡 Thèse

W de retournement identifié, momentum confirmé, OI en reprise.

🎯 Plan

Entrée sur confirmation du W.

ENTRÉE	SORTIE	STOP
0,24782	0,24933	~0,2349

RISQUE
~100 USDT

🔍 Analyse post-trade

Setup correctement identifié, scénario haussier déroulé comme prévu, entrée bonne et thèse validée. Erreur : déplacement du stop à Break Even avant de partir au sport. Une forte mèche baissière a sorti la position avant que le prix ne poursuive sa hausse.

✅ Points forts

- Bonne lecture OI + Funding + Momentum
- Entrée conforme
- Discipline du risque
- Nouvelle validation de la stratégie

⚠️ Points faibles

- Stop remonté trop tôt
- Sortie non liée à une invalidation

LEÇON *Le setup n'a pas échoué, c'est la gestion qui a limité le potentiel. Sur un setup A, éviter de remonter le stop trop agressivement tant que la structure n'est pas invalidée.*

#11 MOVE LONG A+ +2,20R GAIN

Le plus beau setup du challenge · 08/06/2026 · Levier 10x

📊 Contexte

Funding	Extrêmement négatif (~-0,64% à -0,87%)
Open Interest	+49%, continuait de monter pendant la hausse

💡 Thèse

Tous les critères alignés : OI très fort, Funding extrême, Momentum parmi les plus forts du screener, cassure technique propre.

🎯 Plan

Entrée sur confirmation du breakout.

ENTRÉE	SORTIE	STOP	RISQUE
0,01364	0,01513	~0,01300	~100 USDT

🔍 Analyse post-trade

Le marché a validé la thèse de manière spectaculaire avec une extension proche de +5R avant retournement. Stop remonté progressivement sous chaque nouveau creux. Sortie à +2,20R : frustrant après avoir vu +5R latents, mais le marché est ensuite revenu quasiment au point d'entrée. Avec le recul, excellente sortie.

✅ Points forts

- Lecture parfaite du setup
- Exécution conforme
- Gestion dynamique du stop
- Gain important capturé
- Validation forte de la stratégie

⚠️ Points faibles

- Une prise partielle vers +4R/+5R aurait capturé davantage

LEÇON

Probablement la meilleure validation de la stratégie OI + Funding + Momentum depuis le début. Piste : prises partielles sur les A+ pour capturer plus du mouvement.

#12 ESPORTS SHORT A +1,83R GAIN

Confirmation après cassure (note 9/10) · 08/06/2026 · Levier 10x

📊 Contexte

Funding	Élevé, confirmant un excès de longs
Open Interest	Anomalie détectée via l'OI

💡 Thèse

Hausse parabolique, afflux massif d'acheteurs tardifs, structure de distribution sous les sommets, perte du support clé autour de 0,094, momentum baissier confirmé après cassure.

🎯 Plan

Attente de la cassure plutôt qu'une anticipation du top. Entrée sur confirmation du retournement.

ENTRÉE	SORTIE	STOP	RISQUE
0,09426	0,05340	~0,11794	~100 USDT

🔍 Analyse post-trade

Respect parfait de la méthode : entrée après confirmation, pas de top picking, exploitation de la cascade de liquidation des longs, sortie sur extension importante (+43,35% sur le prix).

✅ Points forts

- Attente de la cassure du niveau clé
- Patience avant l'entrée
- Respect du signal Momentum
- Combinaison OI + Funding + Momentum

⚠️ Points faibles

- OI pas assez extrême pour un setup exceptionnel
- Funding élevé mais pas record
- Liquidité limitée

LEÇON

Ne jamais chercher à vendre le sommet. Attendre la confirmation transforme un pari en setup à forte probabilité. La méthode dans toute sa splendeur : OI → Funding → Momentum → Entrée après confirmation.

#13 ESPORTS SHORT A

+0.24R

Confirmation (neckline breakout) · 09/06/2026 · Leverage 10x

WIN

📊 Context

Funding: Binance +0.74% · Bybit +0.67% · Predicted positive

Open Interest: +35% over 24h, +16% over 4h, continuous accumulation

💡 Thesis

Setup prepared through the screening workflow: first 2 pillars solid (real positive funding on Binance/Bybit, OI rising continuously, very liquid, zero BTC correlation). M (double top) forming, entry planned on the breakout of the 0.08075 neckline.

🎯 Plan

Conditional order on the neckline breakout ("Mark" price to filter out wicks). Entry AFTER confirmation, no top picking.

🔍 Post-trade review

The setup worked perfectly: the M got validated, the neckline broke, the drop followed. BUT the trade was managed on M1 (while the analysis and entry were on M5). Too much noise on the lower timeframe → stop profit raised too aggressively → premature exit at +0.24R, while the price then kept dropping hard.

✅ Strengths

- Setup prepared and respected
- Entry AFTER confirmation
- All 3 pillars validated

⚠️ Weaknesses

- Management on M1 = too much noise
- Premature exit that let the move slip away

ENTRY	EXIT	STOP	RISK
0.08080	0.07909	0.08813	~100 USDT

> **LESSON:** *Keep stop management on the same timeframe as the analysis and the entry (M5), not below. M1 overreacts to noise and kills the potential.*

#14 ESPORTS SHORT A

+5.43R

WIN

Re-entry on continuation · 09/06/2026 · Leverage 10x

📊 Context

Funding: Binance +0.74% · Bybit +0.67% · Predicted positive

Open Interest: +35% over 24h, the thesis remained intact

💡 Thesis

After the premature exit from trade #13, the setup was still valid (funding + OI + bearish momentum intact). Decision to re-enter to capture the rest of the drop.

🎯 Plan

Re-entry to the downside, same stop as the previous trade (0.08813).

🔍 Post-trade review

The price kept falling as expected, validating the thesis from start to finish. ⚠️ In full transparency: the position size was entered by mistake in USDT instead of the number of tokens (mobile interface), which heavily oversized the position. The actual gain is therefore well above 1R, but so was the risk taken. Never to be repeated.

✅ Strengths

- Thesis validated from start to finish
- Clean stop management
- Setup respected

⚠️ Weaknesses

- Size entered by mistake (USDT instead of tokens)
- Real but uncontrolled gain: lucky, not repeatable

ENTRY	EXIT	STOP	RISK
0.07768	0.07435	0.08813	~100 USDT (targeted)

> **LESSON:** *Always check the unit of the quantity field (tokens, not USDT) before confirming, especially on mobile. A positive result never validates a risk management error.*

#15 BLEND LONG B

-1.31R

Early entry on exceptional data context · 10/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: Bybit -1.00% · Predicted -4.06%, shorts paying dearly

Open Interest: +149% over 24h, and still climbing when spotted

💡 Thesis

The first two pillars (extreme funding + exploding OI) were perfectly aligned, never seen before in this LONG screening session.

🎯 Plan

Deliberate early entry (price had already climbed a lot, no clean breakout). Structural stop below the consolidation at 0.06288. Tagged "low liquidity".

🔍 Post-trade review

Price topped right in the entry zone, then reversed without ever coming back above it. Then the OI unwound and the price collapsed: the setup had been invalidated. The data was exceptional, but the move was already mature when spotted.

✅ Strengths

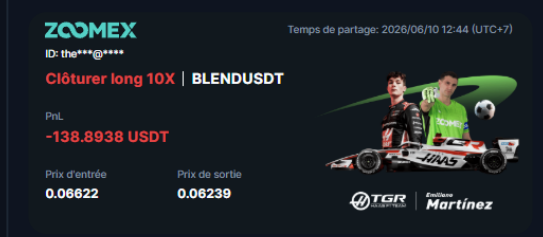

- Genuinely exceptional data setup (not a trap)
- Structural stop, not arbitrary
- Refused the "revenge long" when the OI unwound

⚠️ Weaknesses

- Entry at the top, without a continuation breakout
- Explosive data = move already well advanced
- Slippage on low liquidity (-1R planned, -1.31R actual)

ENTRY	EXIT	STOP	RISK
0.06622	0.06239	0.06288	~106 USDT (1R)

> **LESSON:** *Explosive data only shows up because the move has already started: we often spot the squeeze too late. An "A+" context does not make up for an early entry at the top.*

#16 BLEND LONG A

+3.51R

Entry on structure breakout (W) after a pullback · 10/06/2026 · Leverage 10x

WIN

📊 Context

Funding: Bybit -2.18% · Predicted down to -3.29%, maximum short pressure

Open Interest: rising continuously throughout the trade (up to +281%)

💡 Thesis

Same coin as #15, picked up again later. This time, instead of chasing the price, I wait for a real structure: a double bottom (W). Funding stays extreme.

🎯 Plan

Conditional order on the breakout of the W's neckline (0.06217): entry AFTER confirmation.
Stop below the low of the W.

🔍 Post-trade review

The breakout entry changed everything: no chasing the top, a logical invalidation point. The profit stop below the real impulse avoided a premature exit before the vertical surge.

✅ Strengths

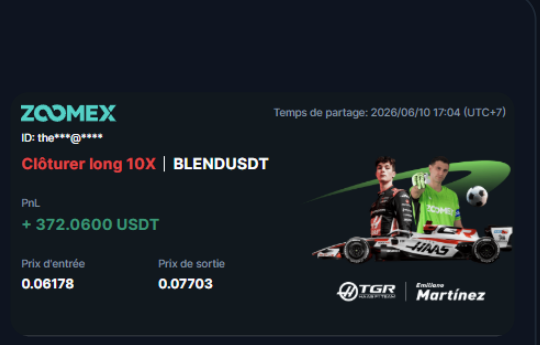

- A entry: order on a validated neckline breakout
- Structural stop below the low of the W
- Disciplined management, stop below the real impulse

⚠️ Weaknesses

- Low-liquidity coin (slippage on entry)
- OI pulling back slightly at the time of entry
- Exit maybe one notch too early (to be confirmed)

ENTRY	EXIT	STOP	WIN
0.06178	0.07703	0.05783	+372 USDT

> **LESSON:** *When the move is already underway, don't chase the price: wait for a structure to break (W for a long) and enter on the breakout. Same coin as the losing #15, but the disciplined entry turned the loss into +3.51R.*

#17 ASTR LONG A

+0.18R

Entry on a W after a stop hunt · 11/06/2026 · Leverage 10x

WIN

📊 Context

Funding: Binance -1.43% · Bybit -1.20%, extreme and clean (no mirage)

Open Interest: +75% over 24h, high but slightly receding (A setup, not A+)

💡 Thesis

Price comes to hunt the stops below a low, then forms a double bottom (W). Instead of chasing, I wait for the W's neckline to break. Funding still extreme.

🎯 Plan

Conditional order placed in advance on the breakout of the W's neckline. Structural stop below the low. Entry AFTER confirmation.

🔍 Post-trade review

Clean execution from start to finish. Stop raised below each impulse (never to breakeven "for peace of mind"), then moved above the entry = profit locked in by the structure. Exit on exhaustion when the OI started to unwind.

✅ Strengths

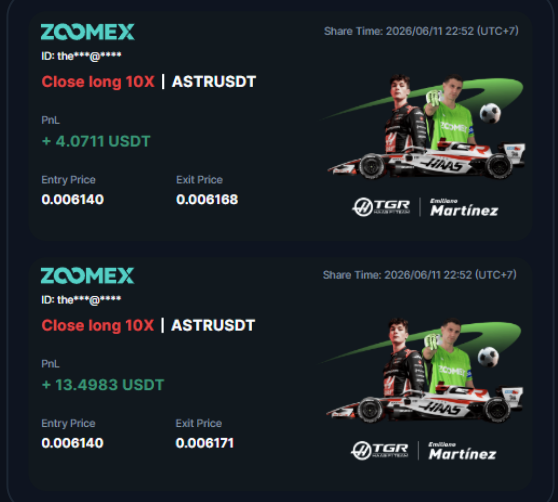

- Patience: waited for the W, no chasing
- Stop managed by the structure, not by emotion
- Disciplined exit on exhaustion

⚠️ Weaknesses

- OI already high: less explosive squeeze (A, not A+)
- Modest win: the move did not reach the hoped-for size

ENTRY	EXIT	STOP	WIN
0.006140	0.006170	0.005974	+17.57 USDT

> **LESSON:** *A small R with perfect execution beats a big win badly managed: wait for the structure, manage the stop by the structure, exit with discipline. Process comes before the size of the win.*

#18 STG LONG A

-0.29R

Structure breakout (cup & handle) then exhaustion · 12/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: Binance -1.87% · Bybit -1.69%, extreme and clean (no mirage)

Open Interest: +20% over 24h, still re-accumulating at entry

💡 Thesis

Extreme funding + OI climbing back. I wait for a structure breakout (top of a cup & handle type consolidation) instead of chasing the price in its trend.

🎯 Plan

Conditional order on the breakout of the plateau. Stop below the last higher low (real invalidation), not in the noise.

🔍 Post-trade review

The entry triggered and the price climbed to +2R unrealized. Then exhaustion: lower highs while the OI started to unwind (end-of-squeeze signal). The stop, raised below the structure, was hit on the pullback.

✅ Strengths

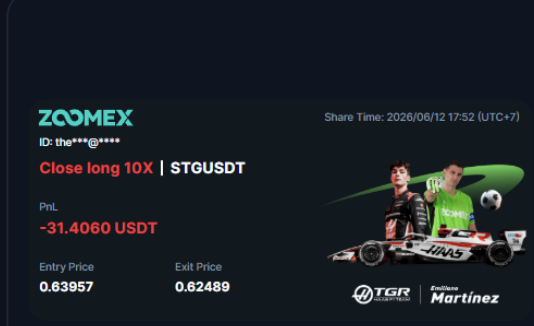

- Entry AFTER the breakout, no chasing
- Stop below structure, never at breakeven
- Clean exit, handled by the stop

⚠️ Weaknesses

- Squeeze that ran out of steam (OI unwound)
- Move did not follow through despite +2R unrealized

ENTRY	EXIT	STOP	LOSS
0.63957	0.62489	0.61619	-31.40 USDT

> **LESSON:** *A well-executed A setup can still lose if the squeeze runs out of steam (OI unwinding). Keep the stop below the structure, never at breakeven: a wick at the funding payment went through the entry without breaking the structure.*

#19 STG LONG A

-0.47R

2nd attempt on STG · neckline pullback · 12/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: Binance -1.40% · Bybit -1.32%, extreme and clean

Open Interest: weak: ~$28.9M, +0.5% over 24h, no longer re-accumulating

💡 Thesis

Same coin as my previous trade, picked up again after a new structure. Funding still extreme, I enter on a clean pullback to the W's neckline rather than chasing.

🎯 Plan

Conditional order on the neckline retest, stop below the real last higher low (true invalidation).

🔍 Post-trade review

Perfect funding, perfect structure… but the OI was no longer re-accumulating: the squeeze had no fuel left. Price drifted back and hit the stop. Key detail: Bitcoin was **rising** at the same time, so the failure did not come from BTC, but from the coin's own exhausted OI.

✅ Strengths

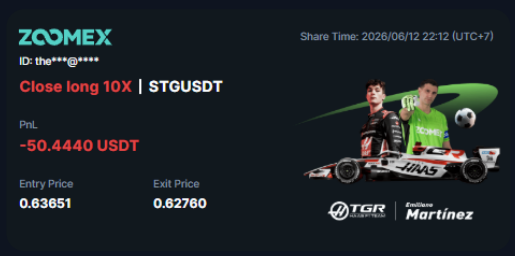

- Entry on a pullback, no chasing
- Emotional stop corrected to below the real structure
- Plan followed through to the end

⚠️ Weaknesses

- OI already weak at entry (no re-accumulation)
- Setup taken despite that warning signal

ENTRY	EXIT	STOP	LOSS
0.63651	0.62760	~0.628	-50.44 USDT

> **LESSON:** *Extreme funding and a perfect structure are not enough: without OI re-accumulating, the squeeze has no fuel. And a failure while BTC is rising proves that the coin's OI, not Bitcoin, is what calls the shots.*

#20 WAVES LONG A

-0.74R

Squeeze on a micro-market · initial SL held · 13/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: extreme negative on Bybit, but gradually weakening

Open Interest: microscopic (~$1.3M), single-exchange, collapsing

💡 Thesis

Extreme negative funding = overloaded shorts, fuel for a bounce. I enter after confirmation, stop below the invalidation structure, and I let the trade breathe.

🎯 Plan

Initial stop set below the low, never moved back. I let the SL do its job without intervening.

🔍 Post-trade review

The funding was there, but the Open Interest never followed: it collapsed continuously, without the slightest re-accumulation. No OI = no fuel = no bounce. Price slid down to the stop. Interesting detail: being long with negative funding, I **collected the funding fees** for the whole duration, which reduced the loss below a full -1R.

✅ Strengths

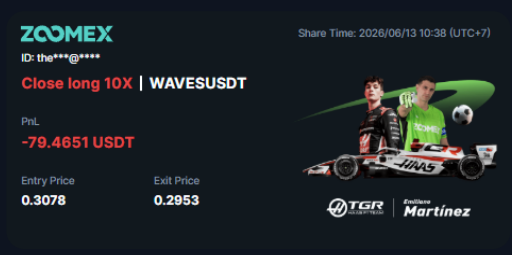

- Initial stop respected, never moved back
- Funding collected = loss cushioned
- Plan held from start to finish

⚠️ Weaknesses

- Tiny OI, already falling at entry
- Single-exchange market = fragile liquidity

ENTRY	EXIT	STOP	LOSS
0.3078	0.2953	0.2951	-79.47 USDT

> **LESSON:** *Extreme funding without Open Interest to back it up is not enough, especially on a micro-market. Good reflex though: a stop that held and, being long on negative funding, fees collected that reduce the loss.*

#21 SAHARA LONG A

-1R

Resistance breakout · the OI lets go after entry · 14/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: negative and clean: Binance -0.66% · Bybit -0.62%

Open Interest: fresh accumulation, still climbing at the breakout

💡 Thesis

The only clean candidate out of nearly 90 coins screened. Negative funding = overloaded shorts, fuel for a bounce. On the M5 the price looked like it was at its highs, but the H1 revealed a **floor** after a big drop.

🎯 Plan

Conditional entry on the breakout of a multi-tested resistance. Stop below the last impulse, never moved back. Manual management.

🔍 Post-trade review

Everything was clean: selection, H1+M5 reading, entry on a real breakout, stop at a real invalidation. The trade even went to **+1R unrealized**. Then the engine cut out: the Open Interest topped and unwound, the funding weakened. **Bad timing, not an execution error.**

✅ Strengths

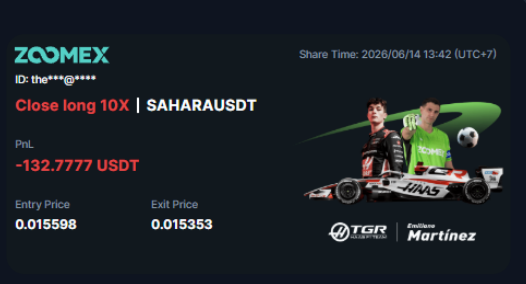

- Only clean setup in the whole screening
- Real confirmation entry (breakout)
- Stop at a double invalidation, never moved back

⚠️ Weaknesses

- OI reversed right after entry
- Market entry → slippage taken

ENTRY	EXIT	STOP	LOSS
0.015564	0.015353	0.015375	-132.78 USDT

> **LESSON:** *Read the price on the H1 (context) before the M5 (execution): what looks like a top can be a floor. And a perfect setup at entry guarantees nothing: when the Open Interest unwinds, the squeeze dies, even with unrealized profit.*

#22 H LONG A

Best data of the day · tight SL hunted · 14/06/2026 · Leverage 10x

-1R

LOSS

📊 Context

Funding: clean and fresh: Binance -1.25% · Bybit predicted -3.77% (and deepening)

Open Interest: massive, $105M multi-exchange, +106%/24h accumulating

💡 Thesis

The best data of the day on two pillars: clean negative funding that keeps deepening + a huge, multi-exchange Open Interest. Ideal fuel for a short squeeze.

🎯 Plan

Entry on the breakout of the high. Deliberate choice of a tight SL (~6%) for a better R:R, even though the coin had just done +85% on the day.

🔍 Post-trade review

The first two pillars were perfect, the OI even kept climbing. The problem: a coin already up 2x on the day breathes violently. My tight SL sat inside that noise zone → **hunted by a simple wick**, then the price took off in my direction. Data never makes up for an entry in the noise.

✅ Strengths

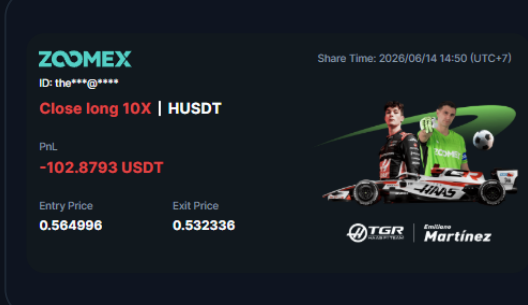

- Exceptional funding + OI data
- Entry on a real breakout

⚠️ Weaknesses

- SL too tight on a parabolic coin
- FOMO: did not wait for a clean structure

ENTRY	EXIT	STOP	LOSS
0.5650	0.5323	0.5300	-102.88 USDT

> **LESSON:** *On a coin that has done 2x on the day, the breathing room is huge: a tight SL gets hunted. You need either a wide SL, or to wait for a real consolidation. Perfect data never excuses an entry in the noise.*

#23 H LONG A

-0.59R

Re-entry · the OI signal ignored · 14/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: still clean and fresh, multi-exchange

Open Interest: $115M, still climbing at entry

💡 Thesis

Re-entry on the same coin after a real clean W, this time with a wide stop below the structure (the lesson from the previous trade applied). The data was still the best of the day.

🎯 Plan

Wide stop at 0.5117 below the W. Exit plan: cut as soon as the Open Interest unwinds (my number 1 end signal).

🔍 Post-trade review

I was in the green, ready to cut at break-even when the OI started to fall, the right reflex. But the funding dropped sharply again and I took it for returning fuel, so I let it run. One minute later: a 14% drop, the OI collapses. **When OI and funding contradict each other, OI wins.** The funding cushioned the loss.

✅ Strengths

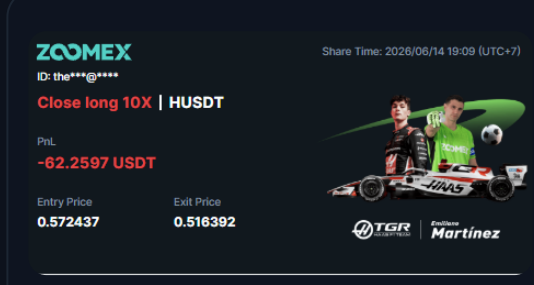

- Wide SL below structure (lesson applied)
- Funding reduced the loss

⚠️ Weaknesses

- OI exit signal ignored
- Funding distracted from the right reflex

ENTRY	EXIT	STOP	LOSS
0.5724	0.5164	0.5117	-62.26 USDT

> **LESSON:** *When the Open Interest (signal number 1) and the funding (signal number 2) contradict each other mid-trade, OI wins. Funding tightening again on an OI that is unwinding is often the last shorts right before the dump, not new fuel.*

#24 HOME LONG A

-1R

W neckline breakout · the squeeze never kicks in · 16/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: extreme and clean: Binance -0.71% · Bybit -1.15%, without Kraken

Open Interest: $25M liquid, fresh re-accumulation after a low

💡 Thesis

Only clean candidate in the screening. Put on the watchlist for lack of structure, then patience rewarded: a stop hunt, a pullback, and a **W** forms on the price AND on the Open Interest.

🎯 Plan

Conditional entry on the breakout of the W's neckline. Stop below the stop hunt already consumed (tight but structural, coin in a calm range).

🔍 Post-trade review

Selection, patience and entry were flawless. But the price ran into the first resistance, got **rejected**, then the Open Interest topped and unwound while the funding faded. **The squeeze never kicked in: market, not execution.**

✅ Strengths

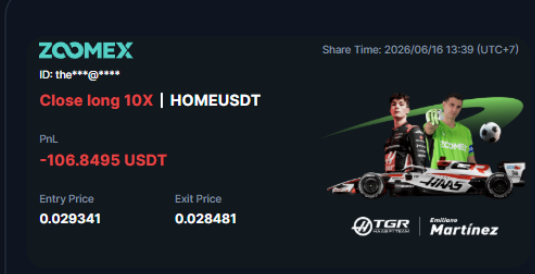

- Patience: waited for pillar 3 (avoided an earlier loss)
- Real confirmation entry (W breakout)
- Stop left to do its job, zero panic

⚠️ Weaknesses

- Rejection at the first resistance
- OI topped, funding faded: fuel exhausted

ENTRY	EXIT	STOP	LOSS
0.029341	0.028481	0.028490	-106.85 USDT

> **LESSON:** *Seen live: when the Open Interest unwinds, the price follows, and extreme funding saves nothing. OI is the final arbiter. A perfect setup at entry that hits a resistance without a squeeze is still a clean loss, not a mistake.*

#25 H LONG A+

-1R

LOSS

1st trade spotted by my automatic radar · neckline fakeout · 17/06/2026 · Leverage 10x

📊 Context

Funding: negative and credible, driven by the big exchanges (OKX -0.55% · Bybit -0.51%)

Open Interest: ~$80M, climbing with the price: shorts starting to get squeezed

💡 Thesis

First signal produced by my automatic detector. Coin not yet gone, price stabilized after a drop (a real base, not a falling knife), funding deepening, Open Interest rising: a squeeze in the making.

🎯 Plan

Conditional entry on the breakout of a **W**'s neckline. Stop below the W (structural). Live monitoring of the Open Interest minute by minute.

🔍 Post-trade review

Everything was in place at entry, flawless execution. But shortly after the breakout, the Open Interest **spiked then receded sharply** and the funding faded: the breakout did not hold, back to the stop. **A market fakeout, not a mistake.**

✅ Strengths

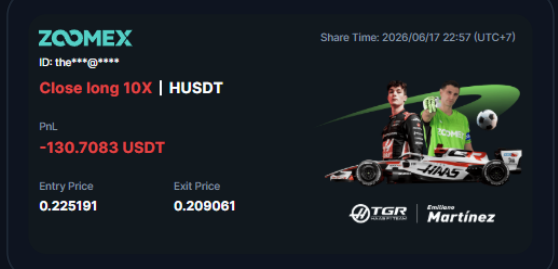

- Automatic detection of a real A+
- Funding validated on the big exchanges
- Structured plan, stop left to do its job

⚠️ Weaknesses

- Open Interest receded right after the breakout
- Breakout not confirmed over time

ENTRY	EXIT	STOP	LOSS
0.225191	0.209061	0.210890	-130.71 USDT

> **LESSON:** *My detector produced a real setup that my eye validated. The loss comes from a fakeout: the Open Interest let go right after the breakout. A perfect setup can lose, that is not a mistake.*

#26 PRL LONG A +0.11R

Patience rewarded: the coin rejected twice becomes a real setup · 18/06/2026 · Leverage 10x

WIN

📊 Context

Funding: negative and credible, carried by the big exchanges (OKX, Bybit, MEXC, Gate)

Open Interest: clean staircase pattern, continuous new highs at the breakout: shorts getting squeezed

💡 Thesis

My radar had gone off twice on this coin earlier, I refused: falling knife. I set an alert and waited. The dump stops, a low forms, a bullish leg breaks the structure. This time it is a real reversal.

🎯 Plan

Entry on the structure breakout, fresh Open Interest confirmed live. Stop below the round number and the first impulse.

🔍 Post-trade review

Flawless entry and management. Stop moved to breakeven from the first impulse, then raised below each new high. When the Open Interest plateaued and the funding calmed down, the price pulled back onto my profit stop. **Exit in profit, the risk had been neutralized early.**

✅ Strengths

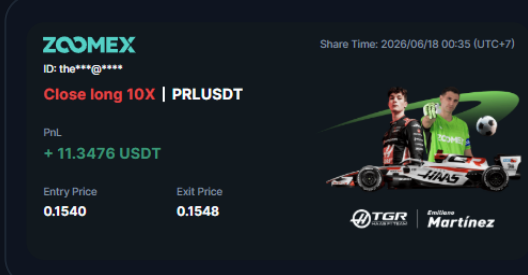

- Patience: refused the falling knife, waited for the reversal
- Fresh Open Interest at the breakout (real green light)
- Dynamic profit stop: gains locked in step by step

⚠️ Weaknesses

- Small market: heavy slippage on exit
- Modest final win compared to the potential

ENTRY	EXIT	STOP	WIN
0.1540	0.1548	0.1497	+11.35 USDT

> **LESSON:** *The same coin can be a trap and then a gift. Rejected twice as a falling knife, it became a real setup once the dump was over and the structure had formed. Patience makes the trade, the radar only signals.*

#27 PRL LONG A

−0.31R

Same coin, one cycle too many, but the management limits the damage · 18/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: still negative but already cooling off: fuel present, not perfect

Open Interest: fresh new all-time high on the breakout: the right entry signal

💡 Thesis

Third cycle of the same coin in the day, spotted by eye without an alert. Open Interest prints a fresh new high on the neckline breakout, the entry is legitimate. But the funding is already fading: this cycle's fuel is partly spent.

🎯 Plan

Conditional entry on the breakout, stop below the last impulse. Then stop raised twice to cut the risk as new highs came in.

🔍 Post-trade review

Open Interest peaked then receded, the funding cooled off, and the price **dropped violently in one go** after a last spike. The profit stop cut it clean. **The real victory is the management: raising the stop twice turned a full loss (−1R) into −0.31R.**

✅ Strengths

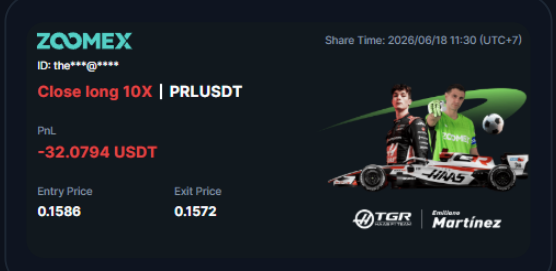

- Fresh Open Interest on the breakout (legitimate entry)
- Exemplary management: stop raised 2× → loss divided by 3
- Reading the outflow live

⚠️ Weaknesses

- Third cycle: fuel already partly spent (funding not perfect)
- Brutal post-top outflow, typical of small markets

ENTRY	EXIT	STOP	LOSS
0.1586	0.1572	0.1543	−32.08 USDT

> **LESSON:** *When Open Interest peaks and the funding cools off, the outflow is often brutal and sudden, not a gentle slide. A tight profit stop at that exact moment is mandatory. And even on a losing trade, disciplined management divides the loss by three.*

#28 ID LONG B

+0.37R

WIN

The 1st trade of the V2 detector: a scratch saved by the data and the funding · 21/06/2026 · Leverage 10x

📊 Context

Funding: negative and plunging (-0.69%), shorts piled up: fuel present

V2 data: ignition active but selling CVD and RSI 80: average signal, late

Heatmap: big liquidation cluster above (~0.034): target and exhaustion

💡 Thesis

First real test of the V2 detector (ignition, CVD, long/short ratio, RSI). Shorts are getting liquidated, a cluster waits above as the target. But we enter at market with no structure, on an overbought 3rd leg: a deliberate bet, saved by the management.

🎯 Plan

Market entry, stop below the zone, target on the cluster. Since the entry is not ideal, everything rides on the management: follow the live data for the exit.

🔍 Post-trade review

Bounce, rejection at the cluster, back to the entry point. **The data did everything:** stop raised above breakeven because the data was weakening. After the exit, the price fell below the impulse: a wide stop would have lost. The green comes from the funding and the discipline, not from the price.

✅ Strengths

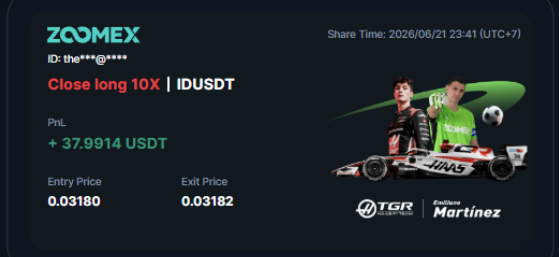

- Exit driven by live data
- Funding collected (+37 USDT)
- Tight stop validated: broke lower afterwards

⚠️ Weaknesses

- Market entry, no structure, late
- 3rd leg, RSI 80: already extended
- No partial on the spike

ENTRY	EXIT	STOP	WIN
0.0318	0.03182	0.03077	+37.99 USDT

> **LESSON:** *The data comes before everything. The tight stop driven by the data beat the "let it breathe" reflex: the price broke lower right after the exit.*

#29 TAIKO LONG A

+4.86R

WIN

The biggest directional win: a perfect early setup, a lucky management · 23/06/2026 · Leverage 10x

📊 Context

Funding: negative and falling, piled-up shorts paying: LONG fuel present

Data: fresh OI accelerating (x2.83), price still flat, RSI on the floor (27): everything is EARLY

Heatmap: a big short liquidation cluster above (~0.077): the target, a magnet

💡 Thesis

The exact profile the strategy looks for: shorts are paying, fresh money is coming in, but the price has not left yet and the RSI is on the floor. We enter EARLY, at the base, before the move. The opposite of #28, entered late and overbought.

🎯 Plan

Entry on the base, tight stop below the structure (1R), target the liquidation cluster above, and let the very negative funding pay while we hold.

🔍 Post-trade review

The very negative funding paid big at every 8h settlement. The price accumulated all night then spiked in the morning. Market exit on a pre-set alert, just before the target: the price then fell.

Honesty: stop not managed overnight, exit on instinct; excellent selection, lucky management.

✅ Strengths

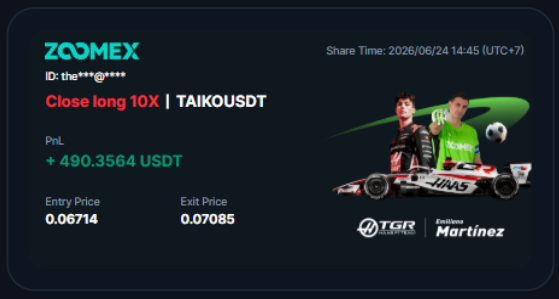

- Clean EARLY entry: flat price, oversold RSI, fresh OI
- Big funding collected on very negative funding
- Exit on alert, just before exhaustion

⚠️ Weaknesses

- Stop not managed overnight: win held by luck
- No partial on the spike
- Exit on instinct, not on the data

ENTRY	EXIT	STOP	WIN
0.06714	0.07085	0.06604	+490.36 USDT

> **LESSON:** *The best entry point is often the quietest: flat price, RSI on the floor, fresh money. And a very negative funding pays big at the 8h settlements.*

#30 OPG LONG B

-1R

LOSS

Breakout with no data fuel, the typical V3.1 false signal · 25/06/2026 · Leverage 10x

📊 Context

Funding: aggregate ~0% at the ping (rebuilt from the API, ping lost), no shorts to squeeze

Data: OI $6.20M to $6.54M on the breakout then back down to $6.18M = false breakout

Heatmap: TP target 0.1827 = top of the day + full liq, never approached

💡 Thesis

First trade taken through the V3.1 SCORE detector. PREMIUM 3/5 ping, but the score came from the OI and the momentum, not from the funding. Bullish breakout of a base towards 0.1602, aiming for a return to the 0.1827 top.

🎯 Plan

Entry 0.1602 on the breakout, structural stop 0.1543 below the base, target 0.1827 (top + liquidation cluster). Risk 1R = 107 USDT, i.e. 1% of the capital.

🔍 Post-trade review

The breakout breaks with no fuel: flat funding (no shorts to squeeze) and OI that pumps on the breakout then recedes within 30 min, longs are trapped, liquidity grab. 24h macro at -9.5% and an illiquid coin (~$6M) make this counter-trend breakout unlikely. Immediate reversal, full stop.

✅ Strengths

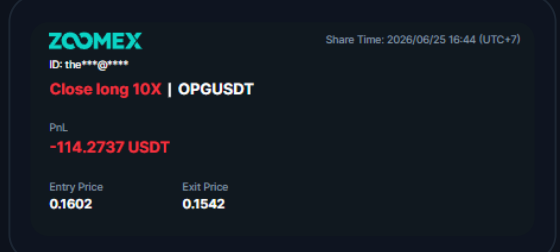

- Entry at the ping, clean
- Tight structural stop
- Disciplined 1R sizing

⚠️ Weaknesses

- Funding ~0, no edge
- OI recedes, false breakout
- Counter-trend 24h + illiquid

ENTRY	EXIT	STOP	LOSS
0.1602	0.1542	0.1543	-114.27 USDT

> **LESSON:** *A breakout with neither aligned funding nor OI that holds = false breakout. The composition of the score comes first: a 3/5 without extreme funding is worth a 1/5.*

#31 ONDO LONG B

-1R

OPG's twin, a liquid breakout but with no data edge · 25/06/2026 · Leverage 10x

LOSS

📊 Context

Funding: aggregate ~0% at the ping (rebuilt from the API), slightly positive = rather anti-long

Data: OI $28.96M to $29.83M on the breakout then back down to $29.6M = false breakout

Heatmap: target 0.3376 = full liq heatmap (not the top), never reached

💡 Thesis

Second V3.1 trade of the day, OPG's twin. PREMIUM 3/5 ping carried by the OI and the momentum. A real bull pattern this time (liquid coin, 24h at +3.2%): breakout of the rally high towards 0.3209.

🎯 Plan

Market entry 0.3209 on the breakout, stop 0.3178 below the structure, target 0.3376 (liquidation cluster). Risk 1R = 107 USDT, i.e. 1% of the capital.

🔍 Post-trade review

Cleaner chart setup than OPG (liquid, in the 24h direction), but the same data flaw: funding ~0 and OI that pumps on the breakout then recedes right away = false breakout, longs get taken out. With no shorts to squeeze, the leg has no fuel. Direct reversal, full stop.

✅ Strengths

- Liquid coin (~$29M)
- Bull pattern in the 24h direction
- Clean entry and stop

⚠️ Weaknesses

- Funding ~0, no edge
- OI recedes, false breakout
- No shorts to squeeze

ENTRY	EXIT	STOP	LOSS
0.3209	0.3176	0.3178	-126.01 USDT

> **LESSON:** *Even a clean, liquid breakout fades without aligned funding. Read the funding BEFORE everything else: 3/5 without extreme funding = 1/5.*

#32 TNSR LONG A

+2.19R

WIN

The cluster squeeze played perfectly, and present this time · 25/06/2026 · Leverage 10x

📊 Context

Funding: funding ~0 at the ping, not a funding squeeze

Data: OI accel x11.63; $13.5K of shorts liquidated = the cluster emptying out

Heatmap: cluster at 0.03754 = the auto TP; the price pierced up to 0.0403

💡 Thesis

PREMIUM 3/5 ping (OI, price, spot; funding ~0). Not a funding setup, a HEATMAP setup: a big short liquidation cluster above = the magnet. The radar flags, the heatmap aims.

🎯 Plan

Wait for a PULLBACK after the ping, entry 0.03523, stop 0.03429 below the structure (1R = 104 USDT), AUTO TP set on the 0.03754 cluster.

🔍 Post-trade review

Model execution: 1h of chop then a vertical short squeeze (+6.77%, $13.5K of shorts liquidated) that empties the cluster up to 0.0403. Auto-TP at 0.03754 = present this time (vs the missed POPCAT/TAIKO). Banked +2.19R without chasing the top.

✅ Strengths

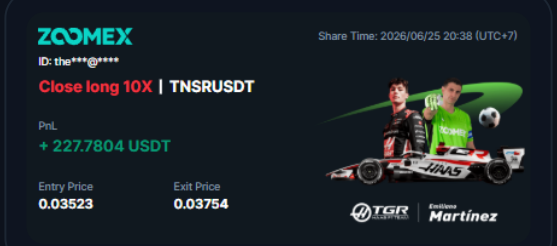

- Patient pullback, perfect entry
- Auto TP on the cluster
- Present (auto-TP)

⚠️ Weaknesses

- Funding ~0, not the funding edge
- Left some R on the table (high +14%)
- Crowd 49/51, no counterparty

ENTRY	EXIT	STOP	WIN
0.03523	0.03754	0.03429	+227.78 USDT

> **LESSON:** *The WIN comes from the CLUSTER + the execution + being present, NOT from the funding (same composition as the losing OPG/ONDO). Confirms the s26 backtest.*

#33 EPIC SHORT A

+3.19R

WIN

The bot's 1st counter-trade, a winner (fading the pump in the middle of a BTC crash) · 25/06/2026 · Leverage 10x

📊 Context

Context: BTC flash crash -> flood of LONGS on the bounce = the worst time to go long

The ping: the bot pinged LONG the TOP of a pump (fakeout) = contrarian SHORT signal

Manage: the v3.3 bot pinged 🔴 OUTFLOW (OI top + CVD turning) = data-driven exit

💡 Thesis

The detector has no edge (backtest), and in the middle of a crash its LONGS on exhausted pumps are shorts. The bet: fade the fakeout on an engulfing candle.

🎯 Plan

Wait for the rejection of the fakeout, short 0.4558, SL 0.4638 above the high, reverse TP 0.4241. 2 fills to put on 1R (coin capped on Zoomex, 2.1M turnover).

🔍 Post-trade review

The pump fades, OI recedes (4.95M -> 4.5M). The manage bot (1st live validation) pings 🔴 OUTFLOW -> aggressive tight SL -> out at ~0.4290 just before the TP. Banked +3.19R (sum of the 2 fills). Slight re-pump afterwards = possible re-test.

✅ Strengths

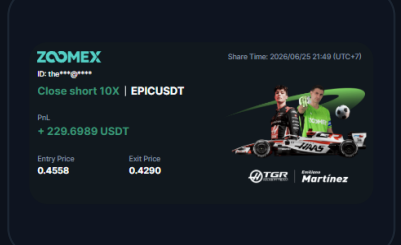

- Reading the crash context = top
- Patient engulfing candle
- Perfect data-driven manage bot

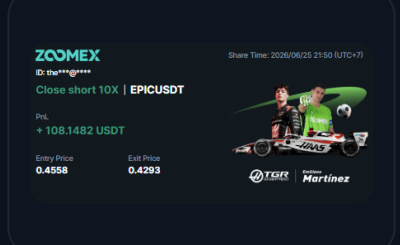

⚠️ Weaknesses

- Counter-trade = outside the bot process
- Out before the TP (but clean)
- Low-liquidity coin (2 fills)

ENTRY	EXIT	STOP	WIN
0.4558	0.4291	0.4638	+337.85 USDT

> **LESSON:** *The 1st WINNING counter-trade: in a crash, the bot's LONGS on exhausted pumps are SHORTS. The edge = YOUR execution + the context, not the detection.*

#34 HMSTR LONG A

+3.36R

WIN

Trend continuation, TP below the cluster · 26/06/2026 · Leverage 10x

📊 Context

Funding: ~0 (OI-weighted +0.01%), not aligned

Data: OI $14.1M to $15.2M, crowd 62% short

Heatmap: short cluster above = TP target

💡 Thesis

The crowd is clearly short in an uptrend and the OI is still rising: underwater shorts to squeeze, continuation more likely than a reversal.

🎯 Plan

Continuation entry at 0.0001693, structural SL 0.0001668 (1R). TP 0.0001778, just below the heatmap cluster to bank without greed.

🔍 Post-trade review

The OI makes new highs all the way to the exit (real continuation, not a false breakout). Funding stays at zero: the engine is not the funding but the cluster and the execution. Orderly grind, with no liquidation cascade.

✅ Strengths

- Continuation entry, no price chasing
- TP set below the cluster, zero greed
- Let the dip breathe, data intact

⚠️ Weaknesses

- Ping already in a high zone (hot 1h RSI)
- Zero funding, edge carried by the execution
- Stressful mid-trade dip to hold

ENTRY	EXIT	STOP	WIN
0.0001693	0.0001778	0.0001668	+368.77 USDT

> **LESSON:** *Letting it breathe is justified by the DATA (OI holding, structure intact), not by hope. The cluster and the execution make the win, not the funding.*

#35 EIGEN LONG B

-1R

LOSS

Funding-zero breakout, the 3rd twin of OPG/ONDO · 26/06/2026 · Leverage 10x

📊 Context

Funding: ~0 (+0.017%), not aligned = anti-long

Data: balanced crowd, OI peak then outflow

Heatmap: TP cluster far away (0.264, +17%)

💡 Thesis

Range breakout aimed at the cluster above. But no fuel at all: zero funding, balanced crowd, no shorts to squeeze.

🎯 Plan

Breakout entry 0.22536, structural SL 0.21663 (1R), TP at the 0.26410 cluster. Wide R:R but on a breakout with no fuel.

🔍 Post-trade review

False breakout: the OI pumped at the top (36.9M) then receded during the drop (trapped longs). Negative CVD all along = no real demand, the price was rising on thin air. Direct reversal to the SL.

✅ Strengths

- Clean structural SL, no comfort BE
- Risk held at 1R, clean exit
- Clear plan: breakout + cluster target

⚠️ Weaknesses

- Breakout with NO fuel (funding 0, neutral crowd)
- Negative CVD = no real demand
- Cluster target too far (+17%) for the fuel

ENTRY	EXIT	STOP	LOSS
0.22536	0.21661	0.21663	-112.12 USDT

> **LESSON:** *A breakout with no fuel (zero funding, neutral crowd, negative CVD) = a coin flip. 3rd twin of OPG/ONDO. V3.4 would have put it in shadow.*

#36 STG LONG B

-1R

LOSS

High-fuel breakout but no ignition · 26/06/2026 · Leverage 10x

📊 Context

Funding: -0.066% aligned (moderate, not extreme)

Data: crowd 68% short, but ignition OFF

Heatmap: TP cluster far away (0.191, +18%)

💡 Thesis

Crowd 68% short + negative funding = big squeeze fuel. Range breakout aimed at the cluster above.

🎯 Plan

Breakout entry 0.16163, structural SL 0.15702 (1R), TP at the 0.19123 cluster. The fuel was there, we were waiting for the ignition.

🔍 Post-trade review

But the squeeze never ignited (ignition OFF all along). The breakout chopped then reversed, the OI unwound, the CVD collapsed. The shorts were right, nothing forced them to cover.

✅ Strengths

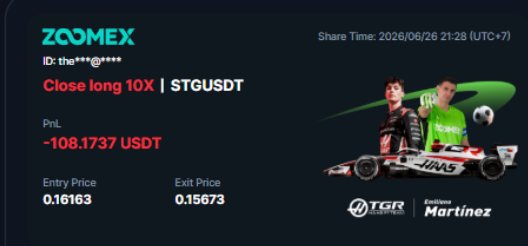

- Real fuel: crowd 68% short + funding
- Clean structural SL, 1R held
- Correct data reading at the start

⚠️ Weaknesses

- No ignition = a squeeze that never takes off
- Choppy breakout, no follow-through
- Cluster target too far (+18%)

ENTRY	EXIT	STOP	LOSS
0.16163	0.15673	0.15702	-108.17 USDT

> **LESSON:** *Fuel (short crowd + funding) without IGNITION = the squeeze never takes off, the shorts win. V3.4 would keep this 4/5: the score is not a magic filter.*

#37 WIF LONG A

+2.04R

The funding-zero breakout that runs all the way to the cluster · 26/06/2026 · Leverage 10x

WIN

📊 Context

Funding: 0.001% aggregate, near zero (context, not a signal).

Data: OI $49.4M +1.75%/15m (×4.86), CVD +123k buyers, 1h RSI 53.

Heatmap: Liquidity cluster ~0.1595-0.16 above = TP target.

💡 Thesis

PREMIUM 3/5 momentum LONG ping on the breakout of the 0.143-0.148 range. Zero funding, but OI accelerating (×4.86) and net buying CVD: demand is pushing towards the heatmap cluster.

🎯 Plan

Breakout entry 0.1474, wide SL below the structure 0.1425 (~3.3% = 1R). Target = heatmap cluster ~0.1595-0.16. Let it run to the cluster or to the SL.

🔍 Post-trade review

In the evening, the price grazes the SL (wick ~0.143) without touching it: structure intact. Overnight, the trend resumes and goes straight to tag the cluster. Exit 0.1593, right on the magnet.

✅ Strengths

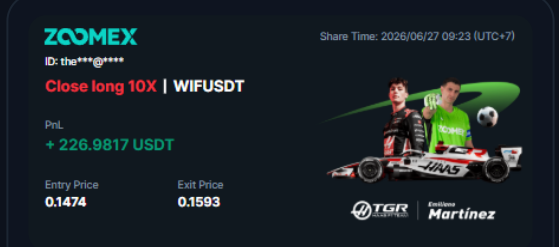

- Well-placed wide SL: absorbs the evening wick without getting stopped.
- Target on the heatmap cluster: exit right on it (0.1593).
- Letting it breathe = right here (SL intact, momentum + buying CVD).

⚠️ Weaknesses

- Zero funding: the profile of the losing breakouts (EIGEN/STG).
- No short counterparty to squeeze: holds on momentum alone.
- Grazes the SL overnight: thin margin, decided by very little.

ENTRY	EXIT	STOP	WIN
0.1474	0.1593	0.1425	+226.98 USDT

> **LESSON:** *A funding-zero breakout can run if momentum + buying CVD + cluster above. Well-placed SL: let it live until the cluster, do not panic on a wick.*

#38 TNSR LONG A

-1R

LOSS

The long trap: negative funding ≠ squeeze · 26/06/2026 · Leverage 10x

📊 Context

Funding: ~0 at the ping, then PLUNGES to -0.82%: shorts piled up, but they were right.

Data: Crowd 53% LONG, CVD deteriorating (-1.4M→-2.1M), OI melting (28→25M), longs liquidated.

Heatmap: Target cluster ~0.046 above, never reached.

💡 Thesis

PREMIUM 3/5 momentum LONG ping on a breakout, ignition ON. The bet: the range breakout continues towards the 0.046 cluster. But the crowd is ALREADY long (53%): it is the longs who are exposed, not the shorts.

🎯 Plan

Breakout entry 0.04080, SL 0.03859 below the range (1R), target cluster ~0.046. No SL management (data-only).

🔍 Post-trade review

The breakout never held. The API data shows it: despite a funding plunging to -0.82% (shorts paying), the CVD stays on the sell side and DETERIORATES, the OI MELTS (28→25M) and it is the LONGS who get liquidated one after another. The shorts were right. The price grinds down to the SL (~03:30).

✅ Strengths

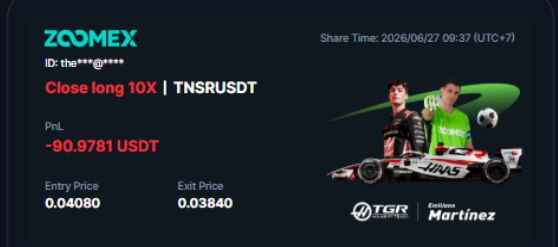

- SL not moved (data-only): loss contained, zero management on hope.
- Funding received (long): loss cushioned to -$90.98 (under 1R).
- The data confirmed the exit: CVD and OI red all along.

⚠️ Weaknesses

- Crowd already 53% LONG: it is the longs who were exposed (trap).
- CVD deteriorating + longs liquidated = no squeeze, the shorts win.
- Funding -0.82% = a decoy: extreme does not mean in MY direction.

ENTRY	EXIT	STOP	LOSS
0.0408	0.0384	0.03859	-90.98 USDT

> **LESSON:** *Extreme funding ≠ squeeze. The green light = OPPOSITE crowd + CVD in my direction + rising OI + the other side liquidated. On TNSR everything was inverted.*

#39 RENDER LONG A +3.10R

The 1st V3.4 trade: short crowd squeezed all the way to the cluster · 26/06/2026 · Leverage 10x

WIN

📊 Context

Funding: 0.002% ~zero (context). The engine is the crowd, not the funding.

Data: Crowd 66% SHORT, buyer CVD (improving), OI x45.6, 1h RSI 54.

Heatmap: Cluster ~1.626 above = TP target, reached (exit 1.6231).

💡 Thesis

1st ping of the V3.4 formula (crowd_against as the engine). Textbook long squeeze profile: 66% SHORT crowd to squeeze + buyer CVD + accelerating OI (x45.6), RSI with room (54). Funding ~0 but it is not the engine.

🎯 Plan

Entry on the PE pullback 1.5340 (below the 1.5411 breakout = better R:R), SL 1.5083 below the structure (1R), target heatmap cluster ~1.626. No SL management (data-only).

🔍 Post-trade review

API data: crowd SHORT the whole way (0.50-0.53), CVD improving (-2.8M -> -1.9M = buyers absorbing), OI holding (42-44M), and $34K of SHORTS liquidated (vs $127 of longs) = a real short squeeze. After the 1st pump to 1.548, several hours of chop (a BE would have been stopped out) then a run to the cluster. Exit 1.6231.

✅ Strengths

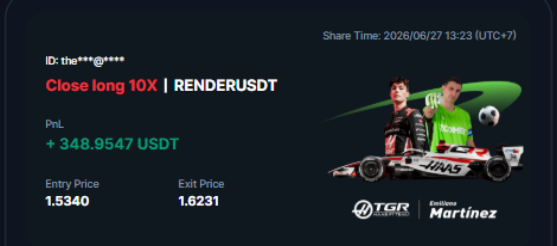

- Perfect V3.4 profile: short crowd + buyer CVD + OI holding = squeeze.
- PE pullback entry (1.5340): R:R optimized vs chasing the breakout.
- SL never moved (data-only): the post-pump chop would have stopped out a BE.

⚠️ Weaknesses

- Funding ~0: no funding edge, everything rests on crowd + flow.
- Long chop for several hours: you have to hold without panicking.
- 0 clean exchanges on the ping (weak funding consensus).

ENTRY	EXIT	STOP	WIN
1.534	1.6231	1.5083	+348.95 USDT

> **LESSON:** *Winning profile confirmed (3rd time): OPPOSITE crowd + CVD in my direction + OI holding + the other side getting liquidated. V3.4 pinged exactly that; SL never moved = the key.*

#40 CHIP LONG B

Setup B, fake breakout · 26/06/2026 · Leverage 10x

-1R

LOSS

📊 Context

Funding: -0.016% oi-weighted, slightly negative

Data: crowd 62% short (crowd_against), CVD +152k, OI x21 (+4%/15m)

Heatmap: big target cluster at 0.0337 (R:R ~3.7)

💡 Thesis

Long squeeze: crowd mostly short = fuel, accelerating OI and market buyers. Target = the big heatmap cluster at 0.0337.

🎯 Plan

Entry on the breakout, SL below the structure (0.0285), TP cluster 0.0337. Mistake: early entry (B) at 0.0296 instead of waiting for the close above the real breakout 0.0302.

🔍 Post-trade review

At the ping the profile is good but does not hold: right from entry the OI drains (28.4M to 26.5M) and the CVD flips back to selling. Zero ignition, no liquidation cascade. Price wicks 0.0302 without ever holding it = fake breakout, then grinds down to the SL.

✅ Strengths

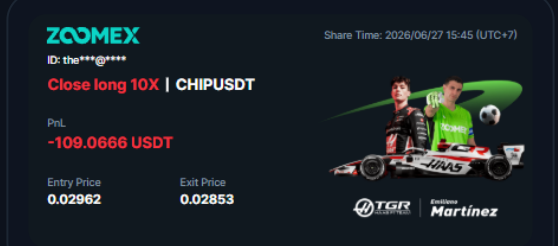

- Good profile at the ping (crowd_against + CVD + accelerating OI)
- Real data target at 3R (the big heatmap cluster)
- SL respected, no averaging down

⚠️ Weaknesses

- Early B entry instead of the real 0.0302 breakout
- Did not wait for confirmation: OI already draining
- The discriminator did not hold after entry

ENTRY	EXIT	STOP	LOSS
0.02962	0.02853	0.02852	-109.07 USDT

> **LESSON:** *The discriminator must KEEP HOLDING after entry (OI expanding, buyers staying, the other side getting liquidated), not just a snapshot at the ping.*

#41 APE SHORT A

+1.42R

Setup A SHORT, exit at the cluster · 26-27/06/2026 · Leverage 10x

WIN

📊 Context

Funding: -0.041% at the ping (oi-weighted), negative

Data: crowd 62% long (crowd_against), seller CVD, OI x0.36

Heatmap: big cluster 0.140 (the 0.1255 TP sits in thin air)

💡 Thesis

Short squeeze: crowd mostly long = fuel, seller CVD. The real magnet = the big heatmap cluster at 0.140; the 2nd cluster at 0.1255 is too far and too small.

🎯 Plan

A entry on the breakout + PE 0.14898, initial SL 0.15568. Data-only management: let it run to the SL or the cluster, then trail below the cluster once reached.

🔍 Post-trade review

Long crowd held for 17h (crowd_against) + seller CVD + longs liquidated = direction validated. But OI bleeding (-11%) = flush by unwinding, no fresh shorts: a move that runs out of steam at the 0.140 cluster. Exit by trailing the SL below the cluster at 0.13948.

✅ Strengths

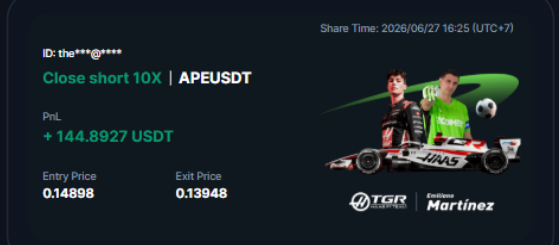

- Data-only management: no premature BE, holding all the way to the cluster
- Target reframed on the real 0.140 cluster (not the thin air at 0.1255)
- SL trailed below the cluster once reached = +1.42R

⚠️ Weaknesses

- Initial TP placed at 0.1255 out of a wish for 3R (reframed mid-trade)
- OI bleeding = squeeze without fresh shorts, limited extension
- Not a 3R: the real cluster was only ~1.4R away

ENTRY	EXIT	STOP	WIN
0.14898	0.13948	0.15568	+144.89 USDT

> **LESSON:** *You bank at the REAL liquidity cluster (the big one), you do not chase a distant 2nd cluster in thin air just to make R. More comfortable exiting with no cluster underneath.*

#42 VELVET LONG A

-1R

LOSS

Setup A LONG, stop-hunt before the cluster · 28/06/2026 · Leverage 5x

📊 Context

Funding: +0.02% at the ping (oi-weighted), near zero

Data: crowd 69% short + smart 71% short (crowd_against), buyer CVD, OI building

Heatmap: target cluster 1.745 (reached), long liquidity below 1.53

💡 Thesis

Real squeeze: crowd AND smart money short = trapped fuel, buyer CVD, OI building. The target = the 1.745 heatmap cluster. WIF/RENDER profile, 1st real squeeze of the day out of 8 pings.

🎯 Plan

A entry on the pullback + PE 1.59826, SL 1.52351 below the consolidation, TP at the 1.85 cluster (3.8R). Data-only management: hold as long as the shorts stay trapped and the CVD holds.

🔍 Post-trade review

Thesis played out 100%: after 4h of battle (shorts never covered), $93K of shorts liquidated in 1 candle propelled the price to the 1.7476 cluster. BUT a flush grabbed the long liquidity (wick to 1.515) and stopped the trade out RIGHT before the explosion. Classic stop-hunt.

✅ Strengths

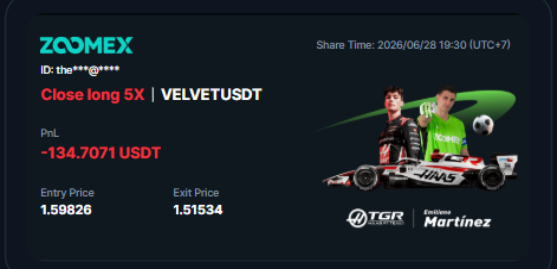

- Thesis 100% right: direction and cluster read perfectly (bot + data)
- Disciplined execution: SL respected, never moved on hope
- Entry on the pullback, not chased: clean R:R at 3.8R

⚠️ Weaknesses

- SL at the obvious level below the consolidation = the stop-hunt's target
- SL inside the liquidity zone (heatmap) instead of below it
- Slippage and fees on a violent alt: real loss beyond 1R

ENTRY	EXIT	STOP	LOSS
1.59826	1.51534	1.52351	-134.71 USDT

> **LESSON:** *On a high-conviction squeeze, the SL goes BELOW the liquidity (heatmap), not at the obvious level that gets swept. Thesis right, hunt taken: the edge is in the stop placement.*

#43 RE LONG A

+0.73R

WIN

Setup A LONG, SL trailed, exit at the cluster · 28/06/2026 · Leverage 10x

📊 Context

Funding: -0.98% (the most extreme of the day), fuel + funding received

Data: crowd 80% short + smart 90% short (crowd_against), OI building

Heatmap: near cluster 0.6542 (reached), far 0.6975 (wrongly targeted)

💡 Thesis

Real squeeze: extreme -0.98% funding + crowd AND smart short (trapped) + OI building. The realistic target = the near cluster ~0.65, not the far 0.6975.

🎯 Plan

A entry on the pullback + PE 0.6217, SL 0.6016 (~3.8R). Away (restaurant): trail the SL above BE, below the impulse candle, to lock it in without being able to follow the data.

🔍 Post-trade review

A cascade of $23.8K of shorts liquidated propelled the price to the near cluster 0.6542. Right at the top: OI peaks (61.3M) + CVD flips + longs liquidated = s23 reversal signature. Price reverses at the cluster and comes back to BE. Trailed SL = exit 0.6306, +0.73R (including +32.72 funding).

✅ Strengths

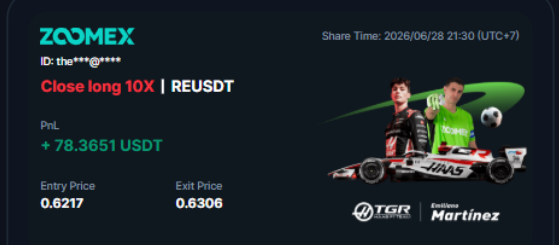

- SL trailed above BE while away = win locked in on the reversal
- Funding -0.98%: paid to hold (+32.72 boost)
- Direction and entry right: real squeeze, disciplined pullback

⚠️ Weaknesses

- TP aimed too far (0.6975) while the real cluster was 0.6542
- No data check at the breakout = missed banking at the top (~1.7R possible)
- Price reverses AT the cluster, again (like APE, VELVET)

ENTRY	EXIT	STOP	WIN
0.6217	0.6306	0.6016	+78.37 USDT

> **LESSON:** *Bank at the FIRST real cluster (the 3R), do not anticipate a distant cluster: price reverses AT the cluster. If available, read the data at the breakout (OI peaks + CVD flips = bank).*

#44 VVV LONG A

-1R

Premium setup A LONG, squeeze without ignition, full stop · 28/06/2026 · Leverage 10x

LOSS

📊 Context

Data: crowd 0.52 AND smart 0.55 short (crowd_against), CVD +, OI building at entry

Ignition: NEVER: $5.6K of shorts liquidated over the window vs $19K of longs

Heatmap: TP cluster 14.495 (4.7R), 1st cluster 14.029 never reached

💡 Thesis

Classic squeeze setup: crowd AND smart short trapped + buyer CVD + OI building. The data seemed to carry toward the 14.495 cluster.

🎯 Plan

Breakout entry + PE 13.6507, SL 13.481 (1R), TP cluster 14.495. Hold in data-only as long as the squeeze pushes (OI build + shorts liquidated).

🔍 Post-trade review

Price climbs to 13.87 (+1.6%) then tops, far from the 1st cluster 14.029. The ignition NEVER comes: shorts barely liquidated ($5.6K), OI peaks at 65.9M at 18:15 then melts. By 22:00 the OI is gone and price is back at BE = the data has flipped. Stopped at 23:15, exit 13.4295 (slippage).

✅ Strengths

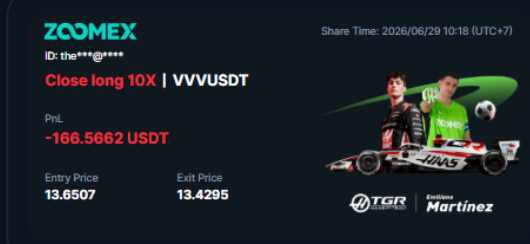

- Static setup correct: clear crowd_against + positive CVD + OI building at entry
- Disciplined entry on the PE, full SL respected (no panic BE)

⚠️ Weaknesses

- Taken on the setup without waiting for the IGNITION (no short cascade)
- 4.7R TP unrealistic vs energy that only carries to +1.6%
- Data-only: ~BE exit missed around 22:00 when the OI gave up

ENTRY	EXIT	STOP	LOSS
13.6507	13.4295	13.481	-166.57 USDT

> **LESSON:** *The setup is not enough: without IGNITION (OI pushing + short cascade), a squeeze is just a grind. Skip it, or cut fast if it does not light up.*

#45 BASED SHORT A

-1R

Premium setup A SHORT, fake breakdown without ignition, full stop · 28/06/2026 · Leverage 10x

LOSS

📊 Context

Data: crowd 1.5 AND smart 1.7 long (crowd_against), seller CVD, empty cluster below

Ignition: NEVER: OI MELTS on the breakdown (27.7M -> 25.3M), longs not trapped

Heatmap: TP cluster 0.07238 (5.8R), never approached

💡 Thesis

Good short profile: crowd AND smart long (to be dumped) + seller CVD + big empty cluster at 0.072. Conditional order to fill only on the breakdown = the ignition.

🎯 Plan

Sell-stop 0.08155, SL 0.08313 (1R), TP cluster 0.07238. Only triggers if price breaks down (cascade of liquidated longs expected).

🔍 Post-trade review

The breakdown fills at 0.08131 then lower at 0.07968 (-2%) and immediate rejection. The OI MELTS the whole way (deleveraging, longs closing, not trapped): no cascade. Price moves back above the entry from 22:00, the crowd grows (1.4->1.85) AND is right. Grind up to the SL at 04:15, exit 0.08358 (slippage).

✅ Strengths

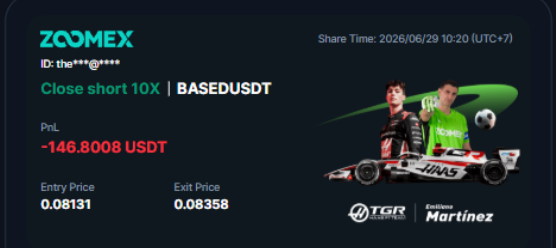

- Static profile correct: clear crowd_against + seller CVD + empty cluster
- Smart conditional order (only take it on the breakdown) + full SL respected

⚠️ Weaknesses

- OI was melting on the breakdown = no ignition: dodge signal ignored
- Fake breakdown: rejection back above the entry in <1h = thesis invalidated
- 5.8R/-11% TP unrealistic vs a -2% move

ENTRY	EXIT	STOP	LOSS
0.08131	0.08358	0.08313	-146.80 USDT

> **LESSON:** *A breakdown without OI building is a fake breakdown: the longs are closing, they are not trapped. No ignition = no trade, even with the right profile.*

#46 CHIP LONG A

BE

Premium setup A LONG, 1st live DATA-ONLY management, BE exit · 29/06/2026 · Leverage 10x

BE

📊 Context

Ping data: crowd 0.79 short (crowd_against) + smart 1.07 long, CVD +6k (noise), OI x1.06

Ignition: NEVER lit: $0 of shorts liquidated in 2h

Heatmap: TP cluster 0.03286 (4.21R), never approached

💡 Thesis

Correct early-stage setup (short crowd, OI building, aligned CVD, cluster at 4.21R), taken EARLY. Watching for the ignition to go to the cluster.

🎯 Plan

PE entry 0.03042, SL 0.02984 (1R), TP cluster 0.03286. 100% data-only management: hold as long as the squeeze is loading, exit if the data flips.

🔍 Post-trade review

2h later: 0 shorts liquidated, 2 pushes to 0.0309 sold back, OI rolling over (peak 28.86M then melts), CVD flipping on the bounce. The data flipped without ever igniting = VVV pattern. Manual exit at BE (0.03043) on the data read, BEFORE the SL.

✅ Strengths

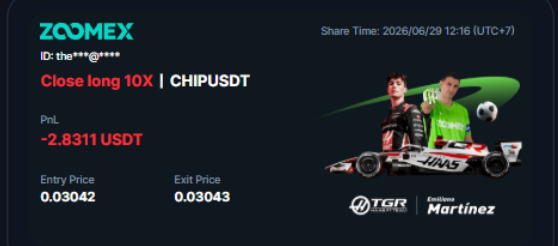

- Live data-only exit: data flipping (OI rolling over + CVD down + 0 ignition) = we get out
- BE locked in instead of a -1R dud (cf. unmanaged VVV/BASED)

⚠️ Weaknesses

- Entry on an early-stage setup but smart money long (not short) = average signal
- CVD +6k at the ping = noise magnitude (real squeeze = +300k)
- Choppy market (hostile regime): little follow-through

ENTRY	EXIT	STOP	BE
0.03042	0.03043	0.02984	-2.83 USDT

> **LESSON:** *1st live data-only management: a setup that does not ignite (0 shorts liquidated, OI rolling over, CVD down) gets exited at BE, not at the SL. The data flips = we get out, no hope.*

#47 ACT LONG A

+1.12R

WIN

Premium setup A LONG (1st V3.7 ping), real ignition, trail below structure · 29/06/2026 · Leverage 10x

📊 Context

Ping data: IGNITION ($18K of shorts ejected) + OI +7.24%/15m + funding -0.10% + CVD +45k

V3.7: premium via the STRONG-OI path (oi_strong), not crowd_against (crowd 61% long)

Heatmap: TP cluster 0.015942 (~3.9R), top at 0.014601 BELOW the cluster

💡 Thesis

Long momentum that IGNITES: shorts liquidated + OI building strongly + aligned funding. 1st ping of the V3.7 strong-OI path.

🎯 Plan

Breakout entry 0.012373, SL 0.011476 (1R), TP cluster 0.015942. Data-only: ride it as long as it ignites, trail the SL below the structure.

🔍 Post-trade review

+24% squeeze (OI +21%, $72K of shorts liquidated) up to 0.014601. BUT a rally fed by LIQUIDATIONS (CVD divergence) = fragile. At 15:05 a violent reversal (CVD -270k, $50K of longs liquidated, OI craters): the SL below 0.013628 catches it at 0.01333 = +1.07R. Far TP never reached.

✅ Strengths

- Plan respected: data + SL BELOW the structure (L12) = catches the reversal in profit
- 1st WIN of the V3.7 strong-OI path, a real ignited trade
- +300 seen, +125 locked in instead of giving it all back

⚠️ Weaknesses

- Liquidation-fueled rally (CVD divergence) = reverses violently
- Crowd already long + RSI 62 = few buyers left to take over
- Far TP 0.015942 never reached (top below the cluster)

ENTRY	EXIT	STOP	WIN
0.012373	0.01333	0.011476	+125.94 USDT

> **LESSON:** *A parabolic move fed by liquidations (CVD divergence) reverses fast once the shorts dry up. The SL trailed BELOW the structure (L12) catches the reversal in profit.*

📊 Context

Ping data: crowd 4.2 long AND smart 4.6 long (STRONG crowd_against), aligned CVD, funding +0.05%

Ignition: NEVER: $5K of longs liquidated in 6h, OI melting (-4.4%)

Heatmap: TP cluster 0.03357 (~4.4R), never approached

💡 Thesis

Good short profile: crowd AND smart massively long (to be dumped) + sustained seller CVD (-330k). TP cluster 0.03357 at 4.4R. We short the breakdown.

🎯 Plan

Breakout entry 0.03638, SL 0.03702 (1R), TP cluster 0.03357. Data-only: hold if the CVD carries + longs liquidated, exit if the data flips.

🔍 Post-trade review

6h of laborious grind (-1.7% max), NEVER any ignition: the longs (4.2) did not capitulate ($5K liquidated), OI bled (-4.4%) instead of trapping. The CVD (the only engine, -330k) STALLED. Price mean-reverted to the 0.03638 entry = BE grab. SL moved to BE = 0R exit (instead of -1R).

✅ Strengths

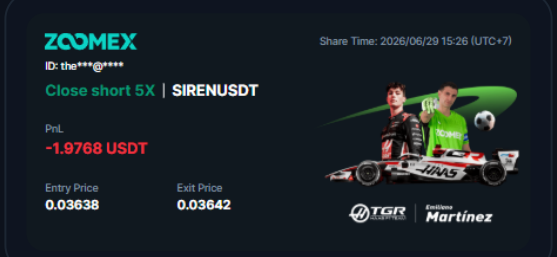

- Data read: sensed the lack of conviction (no ignition + OI melting) -> BE
- BE locked in instead of -1R when price came back (2nd scratch saved that day)

⚠️ Weaknesses

- "Setup without ignition" short: static profile good but the move never came
- OI melting (-4.4%) = longs leaving calmly, not trapped = no fuel
- TP cluster 0.03357 never approached (-6% never traveled)

ENTRY	EXIT	STOP	BE
0.03638	0.03642	0.03702	-1.98 USDT

> **LESSON:** *A short with the right profile but NO ignition (longs not liquidated, OI melting, CVD stalling) mean-reverts. The data-only BE saves the -1R. SHORT version of VVV/BASED.*

#49 RE LONG A

+2.39R

Premium setup A LONG, extreme funding, real squeeze banked at the cluster · 29/06/2026 · Leverage 10x

WIN

📊 Context

Ping data: funding -0.607% EXTREME + crowd 42/58 short (crowd_against) + aligned CVD (4/5)

Ignition: REAL: $154K of shorts liquidated in waves, OI building (+6%)

Heatmap: near cluster 0.6554 (tagged at 0.6589), far TP 0.6975 never reached

💡 Thesis

Real squeeze: extreme -0.607% funding + short crowd (to squeeze) + aligned CVD. Here the extreme funding FUELS (the ignition follows), it is not late.

🎯 Plan

Breakout entry 0.5999, SL 0.5819 (1R), far TP 0.6975. Data-only: ride the ignition, bank at the near cluster, trail below structure.

🔍 Post-trade review

2 legs ($154K of shorts liquidated) up to 0.6589 = tag of the 0.6554 cluster. The 2nd leg in DIVERGENCE (higher price but lower OI+CVD = exhaustion). Banked at the cluster by following the price: exit 0.6444 = +2.39R. Far TP 0.6975 never reached (reversal at the cluster).

✅ Strengths

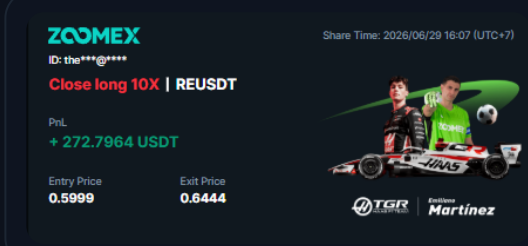

- Real ignited squeeze ($154K of shorts liquidated) ridden cleanly
- Banked at the cluster (divergence) instead of chasing the far TP = +2.39R
- Adaptive trail: wide during the ignition, tight at exhaustion

⚠️ Weaknesses

- Far TP 0.6975 wrongly targeted (price reverses AT the cluster, 4th time)
- Extreme funding = to be watched (worked here because of the ignition)

ENTRY	EXIT	STOP	WIN
0.5999	0.6444	0.5819	+272.80 USDT

> **LESSON:** *Real squeeze (extreme funding + real ignition): bank at the near CLUSTER by following the price, not the far TP (reversal at the cluster, 4th time). Wide trail, then tight at exhaustion.*

#50 VELVET SHORT B+ -0.96R

Setup B+ SHORT V4, data OK but STOP-HUNT: SL at the obvious level swept · 02/07/2026 · Leverage 5x

LOSS

📊 Context

Live data (API): CVD -228k (seller) + crowd/smart 52% short: direction validated

Entry: breakout + RETEST 0.56312 (high entry, R optimized ~3R+ toward 0.44)

Context: trade with ASSUMED RISK: shorting a continuation after -63%, not the bottom

💡 Thesis

Data-backed short (seller CVD), breakdown + retest toward the 0.44 cluster (3R+). But the coin is already -63% = fuel partly burned.

🎯 Plan

Retest entry 0.56312, SL 0.59848 (1R), TP cluster 0.44. Data-only: ride the drop, bank at the cluster.

🔍 Post-trade review

Reached +2.23R (low 0.48424) NOT banked. STOP-HUNT at 21:05: a +20% spike in 10 min sweeps the SL at +7.8% -> -0.96R. Right after, back to 0.515 (below the entry) = liquidity hunt.

✅ Strengths

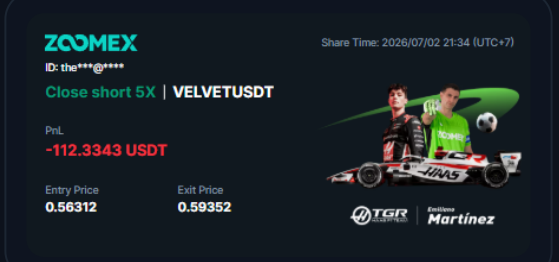

- Direction validated by the live data (seller CVD)
- Disciplined entry on the RETEST of the breakdown
- SL respected, loss controlled (-0.96R)

⚠️ Weaknesses

- SL at the OBVIOUS level above the range = swept (like #42)
- +2.23R not banked: distant cluster instead of partials

ENTRY	EXIT	STOP	LOSS
0.56312	0.59352	0.59848	-112.33 USDT

> **LESSON:** *SL above the LIQUIDITY (heatmap), not at the obvious level. And bank partials: +2.23R given back to -1R.*

#51 LAB LONG A +2.76R

Setup A LONG premium, data-confirmed squeeze, banked in the pre-settlement pop · 02/07/2026 · Leverage 10x

WIN

📊 Context

Live data (API): real squeeze: sustained CVD, OI building, shorts getting liquidated

Entry: THE DESK PING / breakout 9.51465, extreme negative funding (paid to hold)

Target: heatmap cluster 14.56 (far away), intermediate breakout 10.44

💡 Thesis

Premium long on a real squeeze (short crowd paying, shorts getting flushed). The 14.56 cluster is off-map = target in the void; the real magnet was 11-11.3.

🎯 Plan

Entry 9.51465, SL 8.978 then raised to 9.59 (green). Data-only: hold as long as shorts get flushed + CVD holds + OI builds; bank at the clusters.

🔍 Post-trade review

Climbed to +4R at the top (11.76) then gave back half. Data turned in the morning (CVD selling, OI deflating, 0 liqs). Banked in the 11:00 pre-settlement pop at 10.656 (+2.76R), before the instant funding dump (-3.7% in 1 min).

✅ Strengths

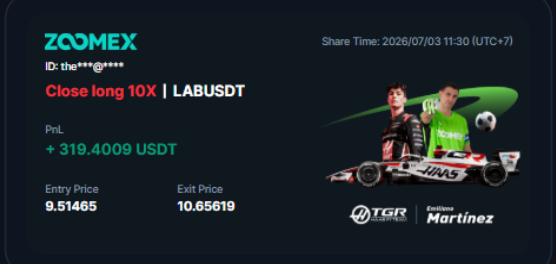

- Squeeze validated by live data before entry (CVD/OI/liqs)
- Banked into pre-settlement strength, BEFORE the funding dump
- Target re-anchored on the real magnet (11-11.3), not the phantom cluster

⚠️ Weaknesses

- +4R at the top not banked, gave back to +2.76R (partials too late)
- Initial TP 14.56 outside any mapped liquidity (target in the void)

ENTRY	EXIT	STOP	WIN
9.51465	10.65619	8.978	+319.40 USDT

> **LESSON:** *Bank into pre-settlement strength (negative funding = a harvest that pushes then dumps). Aim for the real heatmap magnet, not an off-map cluster.*

#52 BIRB LONG B

-1R

Setup B LONG, dud with dead fuel: SL respected, long flush at settlement · 02/07/2026 · Leverage 10x

LOSS

📊 Context

Data at entry: Desk ping + breakout + entry price 0.08806, negative funding, OI +4.21%

Target: heatmap cluster 0.10999, 1st cluster 0.09967

Context: premium but fuel running out (rejected 2x at the 0.098 cluster)

💡 Thesis

Long on the breakout/entry price toward the 0.10999 cluster. But the fuel dies fast: CVD selling, OI bleeding (5.6->4.8M), rejected 2x at the 1st cluster = dud.

🎯 Plan

Entry 0.08806, SL 0.08135 (1R), TP at the cluster. Data-only: let it live until SL/cluster, no preemptive BE.

🔍 Post-trade review

Ranged ~15h underwater, never recovered. In the morning, a $128K long liquidation cascade at 08:00 (post 07:00 settlement) triggered the SL. Fill 0.07794 = -1R, the extra $ = slippage (illiquid coin, 4.7M OI).

✅ Strengths

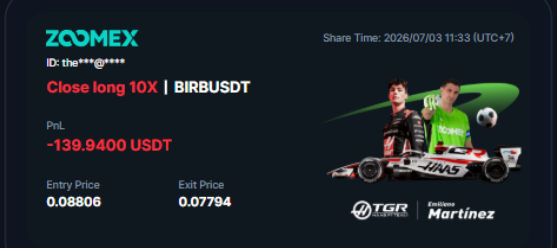

- SL respected without exception: loss capped at -1R
- Same settlement as LAB (00:00 UTC), managed by the data
- No averaging down, no moving the SL

⚠️ Weaknesses

- Dud with dead fuel, readable beforehand (CVD selling, OI bleeding, cluster rejection)
- Slippage on an illiquid coin: the -1R overshoots in $ on the flush candle

ENTRY	EXIT	STOP	LOSS
0.08806	0.07794	0.08135	-139.94 USDT

> **LESSON:** *Sort the fuel at entry: LAB with fuel = win, BIRB without = a clean -1R. SL respected, slippage on a thin coin.*

#53 ARPA LONG A

+1.20R

WIN

Setup A LONG, extreme funding that finally fires (5th ping): disciplined retest entry, banked on exhaustion · 04/07/2026 · Leverage 10x

📊 Context

Data at entry: EXTREME funding -0.28/8h, short liqs firing (18K->9.5K), OI +11%, spot buying

Target: heatmap cluster 0.013044 (R:R 5.96 targeted)

Context: 5th ARPA ping: the first 4 ignored, the squeeze finally fires

💡 Thesis

Long on the retest of the entry price: extreme funding loads the spring and this time the short squeeze FIRES (cascading liqs, OI building, spot leading). Entry on the retest, not chasing the spike.

🎯 Plan

Entry on the retest 0.010631, SL 0.010226 (-3.81% = 1R), TP cluster 0.013044. Data-only: bank on an exhaustion signal, no all-or-nothing hold.

🔍 Post-trade review

Pop to 0.0116 then digestion: perp CVD was still selling but spot+order book+OI had already turned (the perp LAGS, L26). Leg 2 (short liqs, hot RSI) = partial. Exhaustion 5/5 = bank the rest. +1.20R, price stalled before the cluster.

✅ Strengths

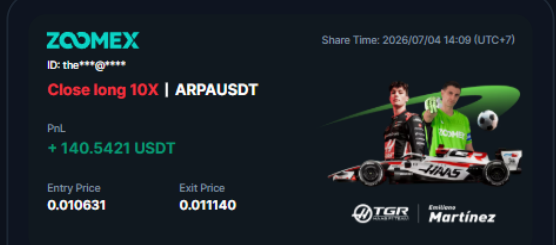

- DISCIPLINED entry on the retest of the entry price, no chasing the vertical spike
- Data management: partial into strength + bank the exhaustion (no hoping)
- Perp CVD read as lagging spot (L26), no premature veto

⚠️ Weaknesses

- crowd_against absent (chronic ARPA trait): setup carried by funding alone
- Modest R at +1.20R: the move stalled before the cluster, exhaustion read correctly

ENTRY	EXIT	STOP	WIN
0.010631	0.01114	0.010226	+140.54 USDT

> **LESSON:** *Perp CVD LAGS on a spot-led pump: when spot+order book+OI turn together, do not let it veto the trade (L26).*

#54 MIRA LONG B +0.06R

Setup B LONG, dud attempted on the breakout: exit at BE via live data BEFORE the dump · 04/07/2026 · Leverage 10x

WIN

📊 Context

Data at entry: EXTREME funding -0.45/-0.55% BUT crowd+smart money 66% already long, RSI 4h 87, 0 squeeze

Target: heatmap cluster 0.05707 (break of the 0.05241 BREAKOUT level)

Context: ping flagged SKIP/dud, attempted on the breakout

💡 Thesis

Long on the breakout toward the 0.05707 cluster. BUT dud profile: extreme funding on a crowd ALREADY long (0 shorts to squeeze), RSI 4h 87, spot selling = no fuel.

🎯 Plan

Entry price 0.05307, SL 0.05176. LIVE data tracking: if the squeeze does not fire, get out fast. Data-only, no holding on hope.

🔍 Post-trade review

Live data confirmed it in real time: 0 liquidations, soft flows, it is not firing. Exit at BE 0.05320 (+0.06R) BEFORE the dump: price plunged to 0.051 (-3.7%) right after. The SKIP was right.

✅ Strengths

- Live data tracking -> exit at BE BEFORE the dump (loss avoided)
- No hoping, no all-or-nothing hold: the data decided
- SL not moved, management discipline

⚠️ Weaknesses

- Entry on a setup ALREADY flagged dud/SKIP (extreme funding + long crowd = trap)
- The edge was the MANAGEMENT, not the entry: setup to avoid next time

ENTRY	EXIT	STOP	WIN
0.05307	0.0532	0.05176	+6.85 USDT

> **LESSON:** *Extreme funding on a crowd that is already long = trap (dud). If you try it anyway, live data tracking lets you exit at BE before the loss.*

#55 MAGMA LONG B -1R

Setup B LONG, conditional with a known weak link (phantom target + crowd_against that does not convert): SL respected, -1R · 04/07/2026 · Leverage 10x

LOSS

📊 Context

Data at entry: strong crowd_against 68% short + RSI room BUT neutral funding + doubtful target

Target: cluster 0.835 (but zone already consumed = phantom; wall at 0.66 BELOW the SL)

Context: conditional discussed, weak link = the "how far" already flagged

💡 Thesis

Conditional long on the pullback/entry price 0.71661 toward 0.835. crowd_against present, defensible at ~4.4R (L23), BUT phantom target + wall below the SL = the 'how far' was the risk.

🎯 Plan

Entry price 0.71661, SL 0.68808. Conditional: enter on the pullback, let the recovery fire. Data-only, SL not moved.

🔍 Post-trade review

MAGMA never fired: crowd_against present but not CONVERTING (absorption, price not responding to CVD, CVD rolling over -). Grind-down -> SL respected, exit 0.68837, -1R (-$126.09, the excess = slippage).

✅ Strengths

- SL RESPECTED: loss capped at ~1R (no moving it, no averaging down)
- Conditional defensible at the start (crowd_against + ~4.4R, L23)
- The weak link had been IDENTIFIED beforehand (phantom target + wall below SL)

⚠️ Weaknesses

- crowd_against PRESENT but not CONVERTING = absorption (price not responding to CVD)
- Phantom target (TP in a consumed zone) + neutral funding: 2 pillars weaker than ARPA

ENTRY	EXIT	STOP	LOSS
0.71661	0.68837	0.68808	-126.09 USDT

> **LESSON:** *crowd_against PRESENT != crowd_against that CONVERTS. If price does not respond to positive CVD (absorption) and the target is a phantom, the squeeze does not fire.*

#56 TLM LONG A

+5.84R

WIN

Setup A LONG, the winning profile (crowd_against + CVD + RSI room + negative funding): early entry on the breakout, held in full, +5.84R · 05/07/2026 · Leverage 10x

📊 Context

Data at entry: crowd_against 54% short + sustained CVD + RSI 52 (room) + negative funding

Target: dense cluster 0.0032-0.0033, TP below the wall at 0.00315

Context: setup coiled before ignition, breakout of the 0.00265-0.00273 range

💡 Thesis

crowd_against + CVD + RSI room + negative funding = squeeze getting started. We enter EARLY on the breakout, not after the pump.

🎯 Plan

Entry on the breakout 0.0027212, structural SL 0.002646 below the base (~5.7R). Doctrine: hold in full, SL never moved, TP inside the liquidity.

🔍 Post-trade review

Ignition fired AFTER the entry: CVD +271K/+296K, OI +33%/5b, short liqs in steps, ask walls eaten. TP filled at 0.0031437 = +5.84R.

✅ Strengths

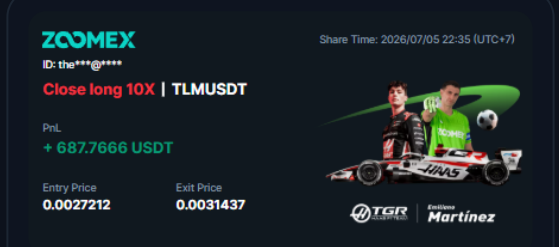

- EARLY entry on the coiled setup, no chasing the pump
- Doctrine held: in full, structural SL never moved (anti-hunt)
- TP inside the liquidity below the dense wall

⚠️ Weaknesses

- Climax called too early (by me): 1 isolated red candle = digestion
- Full TP instead of scaling out while the fuel was strong

ENTRY	EXIT	STOP	WIN
0.0027212	0.0031437	0.002646	+687.77 USDT

> **LESSON:** *Enter EARLY on the setup (crowd_against + CVD + RSI room), not after ignition. Climax = 4 tells over 2-3 candles AND no new OI high, otherwise we hold.*

#57 HMSTR LONG A -0.59R

Setup A LONG, same profile as TLM but it does not convert: cut on RED DATA before the SL, loss contained at -0.59R · 05/07/2026 · Leverage 10x

LOSS

📊 Context

Data at entry: crowd_against + Desk ping, same profile as TLM on the same day

Target: heatmap cluster 0.000442 (~5R), never reached

Context: breakout 0.0003316, SL 0.0003108 below the swing

💡 Thesis

Same winning profile as TLM (crowd_against + premium), long on the breakout toward the 0.000442 cluster. But the profile improves the odds, it guarantees nothing.

🎯 Plan

Entry on the breakout 0.0003316, structural SL 0.0003108 (never moved). Doctrine: hold in full, cut if the data flips to a confirmed RED.

🔍 Post-trade review

The squeeze never fired: ranged without heading to the cluster, then RED data. Exit at 0.0003198 = -0.59R, i.e. 0.41R saved vs the full -1R of the SL.

✅ Strengths

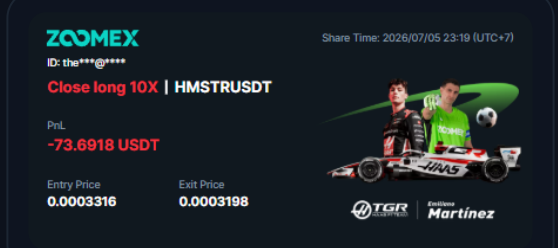

- Data-driven exit on the red flip = loss capped below -1R (0.41R saved)
- Structural SL never moved, clean entry (SL below the swing)
- Same discipline as on the TLM win, on the losing side

⚠️ Weaknesses

- The profile was there but did not convert (like MAGMA)
- crowd_against present != crowd_against that converts

ENTRY	EXIT	STOP	LOSS
0.0003316	0.0003198	0.0003108	-73.69 USDT

> **LESSON:** *A nice profile improves the odds, it guarantees nothing. Cutting on confirmed red data caps the loss below -1R: lose small.*

#58 ID LONG A+

+2.90R

WIN

Setup A+ LONG, early entry on the coiled base, held in FULL up to the 0.03941 heatmap cluster, tagged: +2.90R · 06/07/2026 · Leverage 10x

📊 Context

Data at entry: crowd_against 56% short, extreme negative funding, OI building, CVD flipping green

Target: heatmap cluster 0.03941 (~3.3R targeted), tagged

Context: entry 0.03835 on the setup, SL 0.03803 below the swing

💡 Thesis

Coiled A+ base: crowd_against 56% short, extreme negative funding, OI building. EARLY long before ignition, toward the 0.039-0.040 short liquidity cluster. We enter on the setup, we bank at the cluster.

🎯 Plan

Entry 0.03835 on the confirmed green CVD flip (not the earlier fake-out), structural SL 0.03803 below the swing, never moved. Hold in FULL up to the cluster, bank on ignition.

🔍 Post-trade review

Dip toward the SL bought back on a wall of bids (digestion, no red flip). Standoff below 0.0386-0.0388, false break stalled. Then ignition at the entrance of the 0.039 cluster: the 56% shorts cover, TP 0.03941 tagged, exit 0.03930.

✅ Strengths

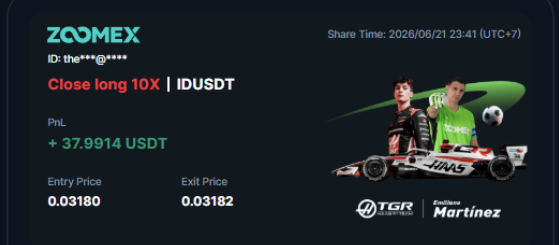

- Early entry on the base, before the pump (setup, not ignition)
- Held in full up to the cluster, zero premature partials
- SL below the swing, never moved (a digestion is not a red flip)

⚠️ Weaknesses

- Exit 0.03930, a notch below the 0.03941 TP (actual fill)
- 1h of standoff to sit through, patience tested before ignition

ENTRY	EXIT	STOP	WIN
0.03835	0.0393	0.03803	+358.97 USDT

> **LESSON:** *Aim for the real clusters at >=3R and hold in full until then: yesterday I did not dare to grind it out, today I aimed for the cluster and it paid me.*

#59 LAB LONG A+

-0.34R

LOSS

Setup A+ LONG, base with EXTREME funding (OKX -0.49) cut on flow ~3/4: PREMATURE CUT, LAB squeezed AFTER the cut, loss -0.34R · 06/07/2026 · Leverage 10x

📊 Context

Data at entry: crowd 74% short + EXTREME funding (OKX -0.49) + CVD +1.64M + short liqs cascade

Target: heatmap cluster 19.299 (~6R), never reached

Context: entry 16.83309 on the flush, SL 16.509 below the swing

💡 Thesis

Strongest A+ base of the day, EXTREME funding (OKX -0.49) = LOADED fuel (shorts not covered). Long toward the 19.299 cluster.

🎯 Plan

Entry on the flush 16.83309, SL 16.509 below the swing. On extreme funding, let the SL define the risk (the fuel is loaded).

🔍 Post-trade review

Cut at 16.73464 on a ~3/4 combo. BUT EXTREME funding + shorts not covered = LOADED base. Re-check: LAB SQUEEZED after the cut (OI 65M->72.8M, funding -1.05) = premature cut.

✅ Strengths

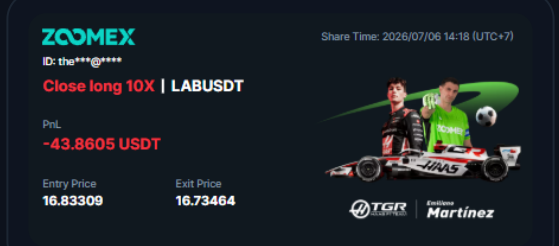

- Loss contained below -1R, exit discipline
- SL below the swing never moved, entry on the flush
- Clean process, disciplined entry

⚠️ Weaknesses

- PREMATURE CUT: EXTREME funding (-0.49) = loaded fuel, squeezed AFTER (L41)
- Cutting on flow alone when the base is extreme = big R left on the table

ENTRY	EXIT	STOP	LOSS
16.83309	16.73464	16.509	-43.86 USDT

> **LESSON:** *L41: on EXTREME funding (-0.49), the fuel is loaded = do NOT cut on flow alone. LAB squeezed AFTER the cut. On an extreme base, let the SL decide.*

#60 TLM LONG A+

-0.76R

LOSS

Setup A+ LONG, MODEST funding (-0.07): GOOD cut on the data, dead-cat bounce then drop BELOW the SL, loss -0.76R · 06/07/2026 · Leverage 10x

📊 Context

Data at entry: crowd 56% short + CVD +342K + short liqs cascade + modest funding + RSI room

Target: heatmap cluster 0.003849 (~7R), never reached

Context: entry 0.003233, SL 0.0031466 below the base

💡 Thesis

TLM = proven converter (#56 +5.84R), same A+ profile toward the 0.003849 cluster. But MODEST funding (-0.07) = LIMITED fuel (the opposite of LAB).

🎯 Plan

Entry 0.003233 on the pullback, SL 0.0031466 below the base. Modest funding = cut if the data flips to a confirmed RED.

🔍 Post-trade review

Push-fade -> cut at 0.0031775 on a ~3/4 combo. Modest funding = limited fuel: re-check = TLM made a DEAD-CAT bounce then dropped BELOW the SL = GOOD cut, the data was right.

✅ Strengths

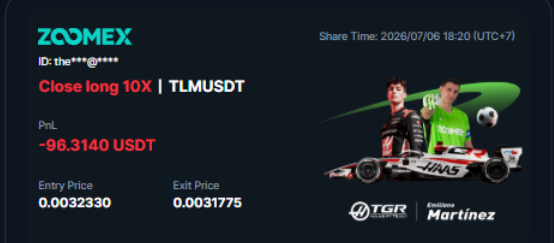

- GOOD cut: the data was right (dead-cat then drop below the SL)
- Loss contained below -1R, SL below the base never moved
- Modest funding read correctly (no loaded fuel to protect)

⚠️ Weaknesses

- Even a proven converter (#56) can fail to convert again
- Mid-squeeze entry (ignition already active) = less ideal than pre-ignition

ENTRY	EXIT	STOP	LOSS
0.003233	0.0031775	0.0031466	-96.31 USDT

> **LESSON:** *L41: the discriminator = the MAGNITUDE of the funding. Modest (-0.07) = limited fuel -> GOOD cut (TLM dead-cat then drop below the SL). Extreme (LAB) = let it run.*

#61 RE LONG A

-0.99R

1st coiled_early of the V4.2 path (A base), SL placed ABOVE the 0.60 liquidity = SL hunt, loss -0.99R · 06/07/2026 · Leverage 10x

LOSS

📊 Context

Data at entry: coiled_early V4.2: crowd 64% short + EXTREME funding (Bybit -0.20) + coil, not yet ignited

Target: heatmap cluster 0.6632 (~7R), never reached

Context: entry 0.6119, SL 0.6044 (above the 0.60 liquidity = hunt risk)

💡 Thesis

1st coiled_early V4.2 ping: A base caught BEFORE ignition (crowd 64% short + extreme funding). Long toward the 0.6632 cluster. The coil can break either way.

🎯 Plan

Entry 0.6119 on the breakout of the coil, SL 0.6044. Trap identified at entry: the SL is ABOVE the 0.60 liquidity = exposed to a hunt.

🔍 Post-trade review

The coil resolved to the DOWNSIDE: price hunted the 0.60 liquidity (wick 0.6010), hitting the 0.6044 SL at 0.6036. Setup caught early but taken OUT by the hunt. -0.99R.

✅ Strengths

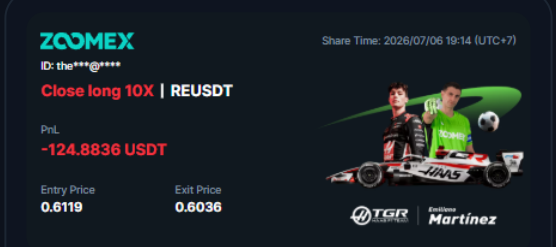

- 1st live catch of the coiled_early V4.2 path (data for the re-check)
- Real base caught early (crowd 64% short + extreme funding)
- Risk defined at the SL, loss capped at ~1R

⚠️ Weaknesses

- SL placed ABOVE the 0.60 liquidity = SL hunt (should be placed BEYOND it)
- coiled_early = earlier but noisier: the coil can break to the downside

ENTRY	EXIT	STOP	LOSS
0.6119	0.6036	0.6044	-124.88 USDT

> **LESSON:** *1st coiled_early V4.2: real base but SL placed ABOVE the 0.60 liquidity = hunt. Place the SL BEYOND the liquidity, not inside it. 1 data point for the re-check.*

#62 RE LONG B+

+0.15R

RE-ENTRY after the SL hunt of #61 (hunt-then-fuse): SL better placed below the liquidity, conservative bank +0.15R · 06/07/2026 · Leverage 10x

WIN

📊 Context

Data at entry: same coiled base, EXTREME funding (Bybit -0.39) + short crowd; reclaim after the 0.60 hunt

Target: heatmap cluster 0.6632 (~5R), banked before

Context: entry 0.6132 on the reclaim, SL 0.6035 BELOW the liquidity (fixes #61)

💡 Thesis

RE hunt-then-fuse (pattern #43/#49): the liquidity below the #61 SL got hunted, then price reclaimed. Re-entry on the reclaim at 0.6132 to capture the recovery.

🎯 Plan

Entry 0.6132 on the reclaim, SL 0.6035 BELOW the 0.60 liquidity (fixes the #61 mistake).
Conservative bank after being hunted.

🔍 Post-trade review

Price reclaimed after the hunt. SMALL bank at 0.6153 (THIN level) = +0.15R, not held up to the 0.6632 cluster = caution after the #61 loss. Recovers part of the -0.99R.

✅ Strengths

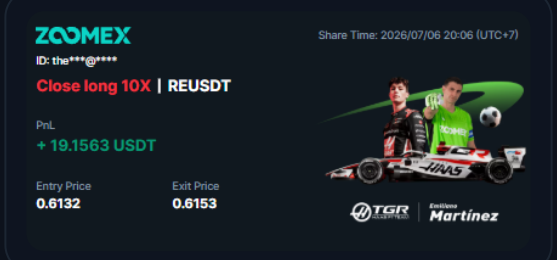

- SL better placed (0.6035 BELOW the 0.60 liquidity, fixes #61)
- Disciplined re-entry on the reclaim (hunt-then-fuse pattern)
- Recovers part of the #61 loss

⚠️ Weaknesses

- Conservative bank (+0.15R, not the cluster) = caution after the hunt
- Small R: the full move to 0.6632 not captured

ENTRY	EXIT	STOP	WIN
0.6132	0.6153	0.6035	+19.16 USDT

> **LESSON:** *RE hunt-then-fuse: the liquidity below the SL gets hunted THEN reclaimed. Re-entry on the reclaim with the SL BELOW the liquidity (fixes #61) = captures the recovery, prudent bank.*

#63 VVV LONG A

+1.31R

WIN

coiled_early V4.2 (2nd catch of the path, 1st WIN): A base that CONVERTS, tagged the 1st cluster, banked +1.31R · 06/07/2026 · Leverage 10x

📊 Context

Target: heatmap cluster 12.499; 1st intermediate cluster 12.112 tagged

Context: entry 11.5298, SL 11.349 below the base

💡 Thesis

coiled_early V4.2: A base caught before ignition (crowd 68% short + green CVD + bids). Long toward the cluster. The base CONVERTED, price responds.

🎯 Plan

Entry 11.5298 on the coil, SL 11.349 below the base. Hold until the cluster; the grind below 11.9 (short liqs below the zone) = normal, don't panic.

🔍 Post-trade review

Grind below 11.9 (short liqs below the zone = normal), then IGNITION -> tags the 1st cluster ~12.11. Banked 11.7913 (FINAL level, BEFORE the cluster) = exit on gut feeling (BTC fear), the data said HOLD (it kept going afterwards).

✅ Strengths

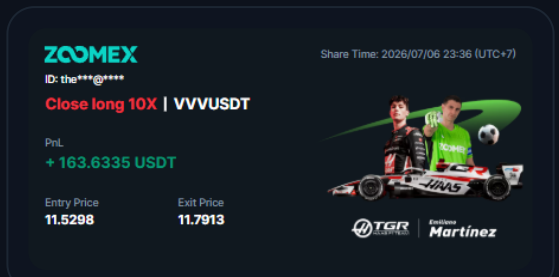

- coiled_early V4.2 that CONVERTS = 1st WIN of the path (+1.31R)
- A base caught early (crowd 68% short + green CVD + bids)
- Didn't panic on the grind below 11.9 (short liqs below the zone)

⚠️ Weaknesses

- Exit ON GUT FEELING (BTC fear), no data pull = money left on the table (it kept going)
- Banked 11.79 before the 12.11 cluster that got tagged afterwards

ENTRY	EXIT	STOP	WIN
11.5298	11.7913	11.349	+163.63 USDT

> **LESSON:** *coiled_early V4.2 that converts = WIN +1.31R. Cut on gut feeling (BTC fear) without data: curb panic EXITS just like entries, pull data before exiting.*

#64 INJ LONG A

+2.31R

WIN

Clean crowd_against base (57% short + green CVD + OI build): held relative strength during the BTC recovery, WIN +2.31R · 06/07/2026 · Leverage 10x

📊 Context

Data at entry: crowd 57% short + CVD 12-win green + OI build + spot buying 2-3.8x

Target: heatmap cluster 4.989, banked before

Context: entry 4.7709 pullback on W (double bottom), SL 4.74

💡 Thesis

Clean crowd_against base (57% short + green CVD + OI build + spot). Long on the pullback (double bottom 4.68-4.71) during the real BTC recovery. The only clean one of the evening burst that converts.

🎯 Plan

Entry 4.7709 on the pullback (double bottom), SL 4.74 (at the edge of the 4.68-4.72 liq magnet, a touch vulnerable). Hold until the 4.989 cluster.

🔍 Post-trade review

Held relative strength during the BTC recovery (L44: the PRICE was pumping, not to be confused with the CVD). Pushed up to ~4.899, banked 4.8453 (FINAL, before the TP) = exit on gut feeling, the data said HOLD.

✅ Strengths

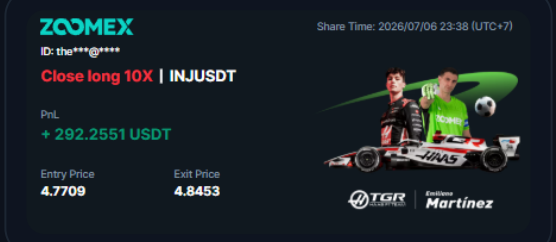

- The only clean one of the evening burst that CONVERTS (crowd_against sort)
- Relative strength held during the BTC recovery
- Disciplined entry on the pullback (double bottom)

⚠️ Weaknesses

- Exit on gut feeling (like VVV), without data = money left on the table
- SL 4.74 at the edge of the liq magnet (a touch vulnerable)

ENTRY	EXIT	STOP	WIN
4.7709	4.8453	4.74	+292.26 USDT

> **LESSON:** *The crowd_against sort isolated INJ (the only clean one that converts in the burst). +2.31R. Cut on gut feeling without data: curb panic exits.*

#65 TLM LONG A

+0.86R

WIN

A setup LONG, relative strength, exit on red flip · 07/07/2026 · Leverage 10x

📊 Context

Relative strength: the breakout holds during a BTC dip = the entry signal

Data: strong sustained CVD +306K, OI +5.7%, spot 2x, 52% short

Heatmap: 1st step 0.00355, big cluster 0.00399 (target ~3R)

💡 Thesis

Coiled_early showing RELATIVE STRENGTH: the breakout holds while BTC dips. Base: strong sustained CVD, OI building, spot buying. The BTC-gate discipline validates the entry.

🎯 Plan

Entry 0.0032902 on the breakout holding (1st attempt right at the SL on a BTC dip = -1R dodged). SL 0.0031156 structural below the range. Target = big cluster 0.00399 (~3R), bank on data flip.

🔍 Post-trade review

Squeeze fires: cascading short liqs, CVD +400K, OI +12%, strong spot, peak +221 at ~0.0036. Then OB flips ask-heavy and the CVD rolls red in steps (-27K to -227K), bids eaten, short liqs dried up = flip CONFIRMED. Exit on a bounce (L43) at 0.0034509.

✅ Strengths

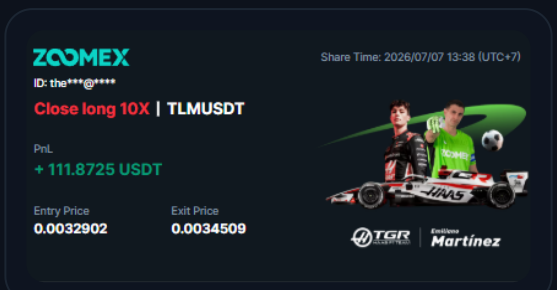

- BTC-gate discipline: -1R dodged on the 1st attempt, entry on relative strength
- Exit on confirmed RED flip (full combo), not on an isolated signal
- Sold the bounce, not the dip (L43): textbook exit execution

⚠️ Weaknesses

- +221 peak given back to +111.87 = the cost of holding-until-the-flip (accepted)
- Modest base (52% short, funding -0.009): not an outright A+
- Big cluster target 0.00399 never reached (flip before)

ENTRY	EXIT	STOP	WIN
0.0032902	0.0034509	0.0031156	+111.87 USDT

> **LESSON:** *Hold until the confirmed RED flip or the cluster, never cut on an isolated yellow signal. Relative strength (holding during a BTC dip) = a real entry signal.*

#66 STG LONG A +1.35R

A setup LONG, full TP on red data right before the crash · 07/07/2026 · Leverage 10x

WIN

📊 Context

Data: coiled_early: crowd_against 66% short + CVD +196K + OI build + RSI room

Heatmap: TP raised to the 0.18792 cluster (3.01M liq on hover) via the protocol

BTC macro: refuses to break 63,500 then rejects = gate #0 bearish

💡 Thesis

Clean coiled_early: entered EARLY on the base (crowd_against + strong CVD + OI build + RSI room). The TP targets the real heatmap cluster 0.18792, not just below it.

🎯 Plan

Entry 0.17168 on the base, SL 0.16838 structural. Target = 0.18792 cluster (~5R). Bank on cluster tag OR on confirmed red data flip.

🔍 Post-trade review

Peak +305 then failure at the 0.18541 check -> distribution (red CVD + spot selling 2x + ask-heavy OB) + BTC rejects 63,500. Full TP on red data at 0.17586. Then STG CRASHED to 0.169 right after = the data saved ~+$300.

✅ Strengths

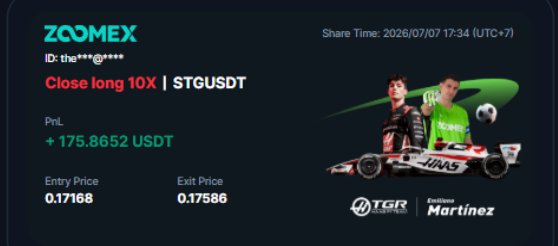

- Full TP on RED data: the post-exit crash validated the read (+$300 saved)
- TP raised to the real heatmap cluster (protocol), not just below price
- BTC gate integrated: the 63,500 resistance rejected = exit signal

⚠️ Weaknesses

- Peak +305 given back to +175.87 = the cost of holding-until-the-flip (a partial would have captured more of the peak)
- Cluster target 0.18792 never reached (failure before the check)
- RSI already warm at ignition = squeeze with less room than expected

ENTRY	EXIT	STOP	WIN
0.17168	0.17586	0.16838	+175.87 USDT

> **LESSON:** *A squeeze that FAILS at the cluster + distribution + BTC rejecting its resistance = TOP/CRASH, not a pullback. Listening to the data (full TP) > hoping for the cluster.*

#67 VVV LONG A

-1R

A setup LONG, perfect base but BTC macro against it · 07/07/2026 · Leverage 10x

LOSS

📊 Context

Base: crowd_against 71% short (crowd AND smart) + RSI 33 oversold + negative funding

Missing: never ignited (short liqs at 0) + moderate upside geometry, magnets below

BTC macro: rejected 63,500 and turned = gate #0 bearish, the macro drag

💡 Thesis

The best base of the day (crowd_against 71% + RSI 33 oversold + negative funding + strong bids). BUT the BTC gate (63,500 rejection) and the lack of ignition stopped it from taking off.

🎯 Plan

Entry 11.0555 on the coiled base, SL 10.877 below the liquidity. Target cluster 12.275. Wait for ignition (short liqs) for the conversion.

🔍 Post-trade review

VVV did NOT distribute (bids at 1.75 were defending, CVD still green, 70% short): it SUFFERED the drag of the BTC reversal, not a clean distribution. Never ignited (short liqs at 0). Closed ~SL at 10.8779 before being away = -146.11 (-1R).

✅ Strengths

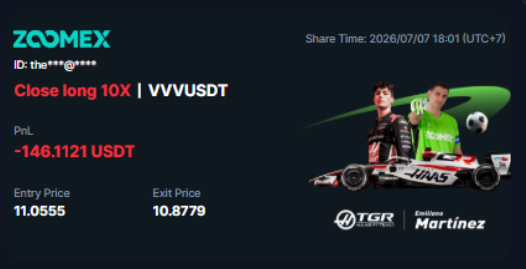

- A+ base read right: crowd_against, RSI oversold, negative funding, strong bids
- Disciplined cut before being away (no hope, SL respected)
- VVV didn't distribute: the thesis wasn't wrong, just the macro timing

⚠️ Weaknesses

- BTC gate ignored at entry: long alt while BTC bumps into its resistance
- Weak geometry (moderate upside, magnets below) = R:R a notch below the others
- Entered BEFORE ignition (short liqs at 0) = bet on a trigger that never came

ENTRY	EXIT	STOP	LOSS
11.0555	10.8779	10.877	-146.11 USDT

> **LESSON:** *A perfect base isn't enough without ignition AND a favorable BTC gate. Gate #0 (BTC direction) outranks the base: good setup + bad macro timing = loss.*

#68 JTO LONG B+

-1R

B+ setup LONG, failed breakout + round-trip to the SL · 07/07/2026 · Leverage 10x

LOSS

📊 Context

Base: coiled: crowd_against 57% short + green CVD + strong bids + OI build

Weakness: RSI 1h 67 warm + positive funding = a notch below VVV

Outcome: breakout never ignited (short liqs 0) + bearish BTC -> round-trip

💡 Thesis

Decent coiled but a notch below the others (warm RSI + positive funding). The 0.7888 breakout needed ignition (short liqs) and a supportive BTC, both absent.

🎯 Plan

Entry 0.7878 on the breakout, SL 0.7814 below the base. Target cluster 0.8099. Wait for ignition (short liqs) for the conversion.

🔍 Post-trade review

Peak +124 BUT FAILED breakout: never ignited (short liqs at 0) + tired spot demand + bearish BTC -> refade -> breakout broken -> round-trip. Exit 0.7806 (below the SL, slippage) = -152.34 (full -1R).

✅ Strengths

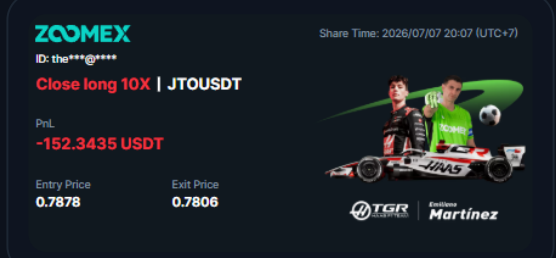

- SL respected (no averaging down, discipline on the loss)
- Geometry and breakout level read right (0.7888 / cluster 0.8099)
- Green at the SL identified as DEFENSIVE, not converting = no trap re-entry

⚠️ Weaknesses

- Breakout held WITHOUT ignition (short liqs 0) = buying the hope of a trigger
- Peak +124/+95 given back all the way to the SL: exit on the green before the round-trip
- Bearish BTC gate ignored: long alt while BTC rolls over = no tailwind

ENTRY	EXIT	STOP	LOSS
0.7878	0.7806	0.7814	-152.34 USDT

> **LESSON:** *A breakout that doesn't ignite (short liqs 0) + tired demand + BTC against it = dead edge: exit on the small green before the round-trip. Defensive green != converting.*

#69 VIRTUAL LONG B+ -1R

B+ setup LONG, BTC-beta passenger with no squeeze, Hormuz macro · 07/07/2026 · Leverage 10x

LOSS

📊 Context

Base: GOOD coiled: 56% short + smart long (divergence) + bid-heavy OB + negative funding

Missing: trigger ABSENT (0 short liq, negative CVD) = a WATCH + BTC-beta passenger (corr +0.82)

Macro: Strait of Hormuz tensions = risk-off, BTC fails 3-4x at 64,234 then rolls over

💡 Thesis

Decent coiled base but WITHOUT a trigger (0 short liq) = a WATCH, not a GO. And a pure BTC-beta passenger (corr +0.82) depends on the BTC catalyst, which failed.

🎯 Plan

Entry 0.5447 on the base, SL 0.5411 below the swing. Target cluster 0.5644. Wait for ignition (short liqs) AND a supportive BTC for the conversion.

🔍 Post-trade review

Peak +177 (~+0.9R) then NEVER a squeeze (0 short liq), ~1h40 at breakeven capped below 0.547 while BTC fails 3-4x at 64,234. Hormuz macro rollover -> bearish BTC gate -> dragged to the SL. Alan was asleep. Exit 0.5405 (slippage) = -172.88 (full -1R).

✅ Strengths

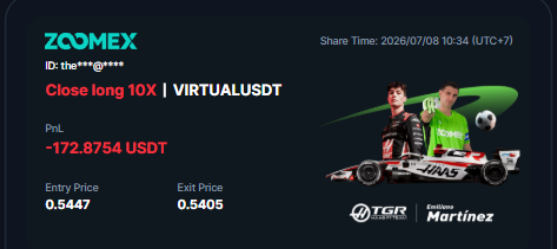

- Base and levels read right (bid-heavy, negative funding, cluster 0.5644)
- Loss capped at 1R by money management (structural SL respected)
- BTC correlation measured (+0.82) = passenger identified in advance

⚠️ Weaknesses

- Entered on a WATCH (0 short liq = trigger absent): setup != entry signal
- BTC-beta passenger kept while the BTC catalyst was failing again and again
- Left open overnight on a tense macro (Hormuz) = no way to monitor

ENTRY	EXIT	STOP	LOSS
0.5447	0.5405	0.5411	-172.88 USDT

> **LESSON:** *BTC-beta without a clean squeeze: when the catalyst (BTC) rejects 2-3x + repeated returns to breakeven + 0 short liq = scratch at breakeven, don't wait for the SL.*

#70 RE LONG A

-0.76R

A setup LONG, counter-crowd + relative strength, killed by the BTC regime · 08/07/2026 · Leverage 10x

LOSS

📊 Context

A entry: the only GO of the morning: 68% short (crowd+smart), sustained CVD+, OI build, negative funding, R:R 6.8R

Rel. strength: RE climbs AGAINST BTC (corr +0.3), trigger confirmed (0.6345 breakout + BTC bounce 62,466)

Killer: BTC rolls toward its 12h lows: RE LOSES its relative strength and leaks even with BTC at 62,466

💡 Thesis

Textbook A setup, but entered on a BTC BOUNCE. When BTC resumed its decline, the relative strength evaporated.

🎯 Plan

Entry 0.6369 on confirmed breakout, structural SL 0.6167. Target 0.764 (R:R 6.8R).

🔍 Post-trade review

Peak +0.55R (0.6494), CVD/OI accelerating. Then BTC rolls toward its lows: RE leaks while BTC still holds 62,466 = relative strength breaks down. Break of 0.6311 -> cut on trigger BEFORE the SL. Exit 0.6222 = -97.42 (-0.76R).

✅ Strengths

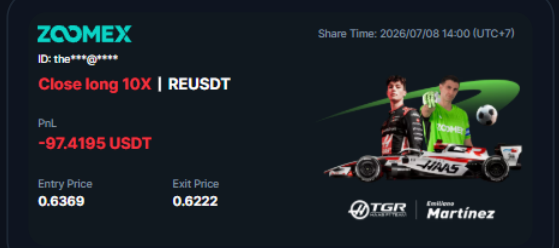

- A-grade entry: the only GO out of ~14 pings (counter-crowd crowd+smart, CVD+, R:R 6.8R)
- Cut on trigger at -0.76R, not -1R: structural SL untouched, zero "let it breathe"
- Relative strength measured and tracked (its breakdown served as the exit signal)

⚠️ Weaknesses

- Entered on a BTC BOUNCE (fragile relative strength), not against a red BTC
- The macro regime (BTC in a downtrend) outranked a perfect base
- Flawless execution: the BTC context was missing

ENTRY	EXIT	STOP	LOSS
0.6369	0.6222	0.6167	-97.42 USDT

> **LESSON:** *Relative strength is an entry condition that evaporates: a counter-crowd long on a BTC bounce dies when BTC resumes its decline. The BTC regime rules.*

#71 PENGU LONG A

-1R

A setup LONG, full green data on the only liquid coin, killed by the risk-off regime · 09/07/2026 · 10x

LOSS

📊 Context

A entry: 58% short, CVD reflip green, OI build, neg funding, R:R 5.33R

Liquid: the ONLY truly liquid coin of the day (near-book 16x)

Killer: reflip that fades in a risk-off market (war) + neutral BTC

💡 Thesis

Full green data on a coin that's finally liquid. Confirmed entry + structural SL below the swing. Good setup, but the risk-off market didn't let it run.

🎯 Plan

Entry 0.006155 on green data, structural SL1 0.006128 (not the jammed SL2). Target 0.006299 (R:R 5.33R).

🔍 Post-trade review

Price wicks to 0.006133: SL2 hunted, SL1 survives. Then reflip fades + neutral BTC. Exit 0.006120 = -194.35 (R -1; real -1.55R: wick + fees).

✅ Strengths

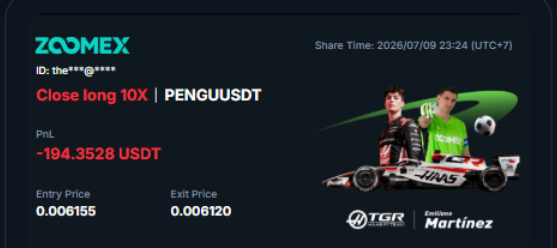

- Entry on confirmed GREEN DATA, the only liquid coin
- Structural SL1 > jammed SL2: survived the hunt
- Held in full until invalidation, SL never moved

⚠️ Weaknesses

- Young green reflip, faded fast in a risk-off market
- MARKET entry: ~0.27R of fees that a LIMIT would rebate
- Wick-through 0.30R at the fill (capped because liquid)

ENTRY	EXIT	STOP	LOSS
0.006155	0.00612	0.006128	-194.35 USDT

> **LESSON:** *Flawless process: green data + structural SL + hold. The loss = the risk-off regime, not the analysis. Liquidity protects the STOP, not just the entry.*

#72 WIF LONG A+ -1R

A+ setup LONG, the only GO of the day (whale = liquidity finally OK), held in full but never ignited: 3rd victim of the BTC regime · 10/07/2026 · Leverage 10x LOSS

📊 Context

A+ entry: the only GO of the day: whale liquid (4.5x $50K), W-bottom on confirmed M5 breakout, 56% short, R:R 4.1R

Killer: never ignited: BTC dip at entry + dead spot demand (x59->x1)

Stop hunted: SL 0.1528 jammed above the 0.152 swing (L29), wicked then bounced to 0.1546

💡 Thesis

The only GO of the day, unlocked by whale liquidity finally green. Confirmed entry, held in full. The risk-off BTC regime didn't let it ignite (3rd time: RE, PENGU, WIF).

🎯 Plan

Entry 0.1546 (buy-stop on M5 breakout), SL 0.1528, target cluster 0.1620 (R:R 4.1R). Whale liquid, 56% short, BTC decoupled +0.27.

🔍 Post-trade review

No ignition at all: BTC dips at entry, dead spot demand (x59->x1), CVD grinding. Slow bleed down to the stop. The SL jammed above the swing gets wicked (~02:00) then bounces to 0.1546. Exit -175.75 (real -1.41R: oversized + wick + fees).

✅ Strengths

- The only GO of the day: whale liquidity finally green, W-bottom on M5 breakout (no FOMO)
- Held in full down to the stop, structural SL never moved (A+ discipline)
- Cut owned: clean -1R, the loss = the regime

⚠️ Weaknesses

- SL jammed above the 0.152 swing (L29): hunted by the wick
- Buy-stop: degraded fill, position oversized at 1.14R
- 3rd long taken in a risk-off BTC regime that smothers ignition

ENTRY	EXIT	STOP	LOSS
0.1546	0.1526	0.1528	-175.75 USDT

> **LESSON:** *The risk-off BTC regime kills a good setup for the 3rd time (RE, PENGU, WIF). An SL jammed above the swing gets hunted: the wide structural stop protects from the hunt.*

#73 HBAR LONG B

-1R

GO taken on a contrarian base but tight SL near the magnet, hunted by a cascading wick-through · 11/07/2026 · Leverage 10x

LOSS

📊 Context

B entry: GO after the green: 55% short, spot buy, bid-heavy OB, target cluster 0.07142

Killer: risk-off BTC bearish cascade: wick-through that cuts through the SL

Stop hunted: SL 0.06983 jammed near the 0.069 magnet (L29), fill 0.06975 below

💡 Thesis

GO taken after waiting for a green signal. The contrarian base was there (crowd short, spot buy, bid-heavy OB). But the SL was tight near the 0.069 magnet, with no unhuntable 3R.

🎯 Plan

Entry 0.07009 on confirmation, SL 0.06983, target cluster 0.07142. SL in the hunt zone (0.069 magnet right below).

🔍 Post-trade review

The breakout didn't hold: bearish cascade (risk-off BTC) that cuts through the SL in one go. Fill 0.06975 BELOW the stop = wick-through, the loss overshoots -1R (real -1.52R). SL jammed near the magnet, hunted: L29/L64 trap.

✅ Strengths

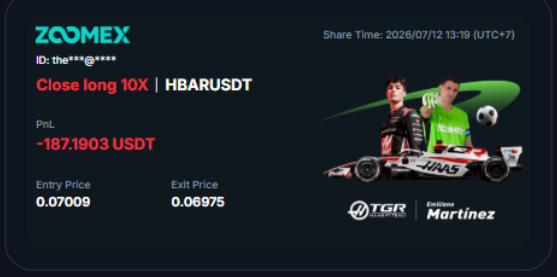

- Disciplined GO: entry after the green signal (no FOMO)
- Real contrarian base: crowd short, spot buy, bid-heavy OB
- Loss owned: cut at the stop, zero averaging

⚠️ Weaknesses

- Tight SL jammed near the 0.069 magnet (L29), no unhuntable 3R
- Cascading wick-through: loss overshoots -1R (real -1.52R)
- Yet another long in a risk-off BTC regime

ENTRY	EXIT	STOP	LOSS
0.07009	0.06975	0.06983	-187.19 USDT

> **LESSON:** *A tight SL jammed near a magnet gets cut through in a cascade: the loss overshoots -1R. The wide structural stop protects from the wick-through (L64).*

#74 PARTI LONG B

-1R

LOSS

Override of a knife/thin veto in far-target shrimp size: the thesis fails but the extreme funding makes the mistake almost free · 11/07/2026 · Leverage 10x

📊 Context

Veto ignored: THIN liquidity (near 0.3x, slippage 3-6%) + dead-cat off -12%: SKIP recommended

Size: taken in far-target shrimp size (~$1,910), SL 0.03226 below the 12h range

Rescue: extreme funding collected ~+$41 that soaks up the ~-$66 price loss

💡 Thesis

The data veto said SKIP: thin liquidity + dead-cat bounce on a falling knife. Overridden in far-target shrimp size. The price thesis failed (12h grind, never a green higher-low), SL hit. But the extreme funding made the mistake almost free.

🎯 Plan

Entry 0.03332, SL 0.03226 (below the 12h range, real invalidation), target cluster 0.0405. Extreme neg funding + 60% short = fuel, but falling knife + thin.

🔍 Post-trade review

12h downward grind, lower highs, never a green higher-low (the entry signal was missing). SL filled 0.03217, ~0.27% below the stop (the thin book costs you). R -1 but net PnL only -26.59: extreme funding ~+$41 against a ~-$66 price loss.

✅ Strengths

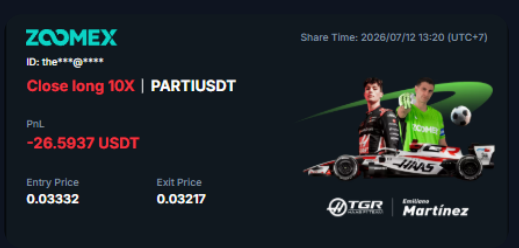

- SL well placed below the 12h range (real invalidation, not an L64 jam)
- Shrimp size: the mistake stayed small (-$26.59)
- Extreme funding collected: it cushioned the loss

⚠️ Weaknesses

- Override of a data veto (thin + dead-cat knife), entry without a green higher-low
- Extreme funding = SCALP (exit post-settlement), not a 12h swing
- Funding insures the loss, it doesn't make you win: the price thesis failed

ENTRY	EXIT	STOP	LOSS
0.03332	0.03217	0.03226	-26.59 USDT

> **LESSON:** *Don't override a knife/thin veto without a green higher-low. Extreme funding insures the loss, it doesn't make you win: it's a scalp, not a swing.*

#75 ZEC LONG B+

+3.39R

WIN

Breakout + pullback on a complete contrarian base: cut at the 12h cluster (new TP doctrine), the WIN that breaks the streak of 8 · 12/07/2026 · Leverage 10x

📊 Context

GO base: crowd 63% short (contrarian), CVD +2.85M aligned, OI +2.1% expanding, liquid 26.9x, BTC neutral

B+ entry: range breakout + pullback + PE 517.58, SL 513.36

Doctrine: manual cut at the 12h cluster ~532, NOT at the 24h TP 539.99, never reached

💡 Thesis

Breakout of the 500-540 range + pullback onto the level, confirmed entry. Complete contrarian base (crowd short, CVD aligned, OI expanding, liquid). Price rushed into the 12h cluster then got rejected: bank there, not at the 24h cluster.

🎯 Plan

Entry 517.58 (breakout+pullback+PE), SL 513.36, target the cluster. Crowd 63% short (contrarian), CVD +2.85M, OI expanding, relative strength vs BTC (neutral).

🔍 Post-trade review

Clean climb to the 12h cluster (~534). Manual cut at 532.18 right at the rejection, without waiting for the 24h TP 539.99 (never reached, would have given everything back). +409.35 net = +3.39R. Bot silent (no flip, correct HOLD). 1st application of the 12h TP doctrine.

✅ Strengths

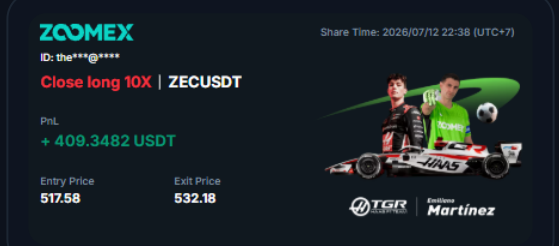

- COMPLETE contrarian base: crowd short + CVD aligned + OI expanding + liquid
- Confirmed entry (breakout + pullback), no FOMO
- Banked at the REAL magnet (12h cluster), not the 24h mirage = +3.39R secured

⚠️ Weaknesses

- SL 513.36 jammed 7 cents above the 513.29 swing (wick-risk L64)
- Initial TP set at the 24h (539.99) = too far, had to manage by hand
- Discretionary cut at the 12h cluster = to be formalized as a rule (done, L69)

ENTRY	EXIT	STOP	WIN
517.58	532.18	513.36	+409.35 USDT

LESSON: *The TP = the 12h cluster (the real magnet), not the 24h (mirage). Banking at the level where price turns around finally breaks the streak. L69.*

#76 SXT LONG B

+1.61R

WIN

Extreme-funding scalp on breakout + PE: held past the settlement, banked near the high (the 24h cluster never reached) · 12/07/2026 · Leverage 10x

📊 Context

GO base: CVD +732k aligned, OI +16.4% expanding, short liqs, spot buying, decorrelated from BTC

B entry: breakout + PE 0.009052 on the RETEST (patience after a limit miss), SL 0.0086

Funding: extreme -0.92% (shorts pay) = fuel + rebate collected

💡 Thesis

Extreme-funding scalp on range breakout + retest. Aligned base (CVD, OI expanding, short liqs). Filled on the retest after a limit miss (patience > chase). Held past the settlement because the breakout was running.

🎯 Plan

Entry 0.009052 (breakout retest+PE), SL 0.0086, target the cluster. Extreme funding -0.92%, CVD +732k aligned, OI +16.4% expanding.

🔍 Post-trade review

Clean breakout, climb to 0.009932. Banked at 0.009680 near the high, the 24h cluster 0.01061 NEVER reached (12h TP doctrine confirmed once again). +201.74 net = +1.61R (price + funding collected - fees). 2nd WIN in a row.

✅ Strengths

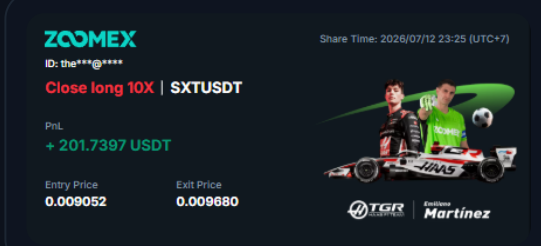

- Complete aligned base (CVD + OI expanding + short liqs + spot buying)
- Filled on the RETEST after a limit miss (patience > chase, discipline)
- Banked near the high, not at the 24h mirage = +1.61R secured

⚠️ Weaknesses

- Extreme-funding scalp = the PARTI type (risky), saved by a real breakout
- Held past the ~19:00 settlement (against the scalp plan) but it paid off
- Initial target at the 24h cluster 0.01061 = too far (12h TP doctrine)

ENTRY	EXIT	STOP	WIN
0.009052	0.00968	0.0086	+201.74 USDT

#77 VVV LONG B+

+0.58R

WIN

Shrimp W-bottom on a strong base: climbed to the 12h cluster but held for the 24h -> round-trip, salvaged a small win (the 12h TP doctrine in reverse) · 11/07/2026 · Leverage 10x

📊 Context

GO base: W-bottom + neckline break, crowd 69% short (big fuel), CVD building, OB bid-heavy, decorrelated from BTC

The trap: climbed to the 12h cluster 10.941 (+3.4R available) but HELD for the 24h TP 11.32

Outcome: round-trip, banked 10.5662 (+0.58R) near BE before the SL

💡 Thesis

Shrimp W-bottom on a strong contrarian base (69% short). Price climbed to the 10.941 cluster, but held while aiming for the 24h TP 11.32. Round-trip: came back down, banked small before the SL.

🎯 Plan

Entry 10.467 (W neckline break), SL 10.329, TP aimed at the 24h cluster 11.32. Crowd 69% short, CVD building, OB bid-heavy, decorrelated from BTC.

🔍 Post-trade review

Climbed to the 12h cluster 10.941 (+4.5% = ~+3.4R available). HELD for the 24h 11.32 (never reached) -> round-trip, came back down. Banked 10.5662 (+0.58R) near BE, before the SL. The 12h TP doctrine IN REVERSE: banking at the 12h would have made ~+3.4R.

✅ Strengths

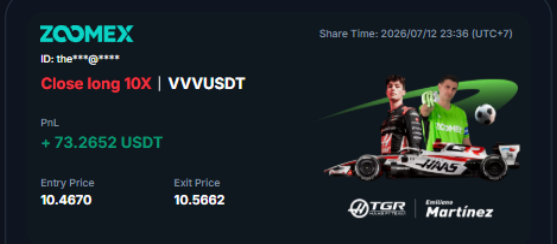

- STRONG contrarian base: W-bottom + 69% short + CVD building + OB bid-heavy
- Salvage: cut near BE, avoided the SL on the round-trip
- Decorrelated from BTC (relative strength)

⚠️ Weaknesses

- HELD for the 24h TP 11.32 (never reached) instead of banking at the 12h cluster 10.941
- Gain divided by ~6 vs the 12h cluster (+0.58R instead of ~+3.4R)
- 3rd confirmation of the day that the 24h = mirage (L69), here as a counter-example

ENTRY	EXIT	STOP	WIN
10.467	10.5662	10.329	+73.27 USDT

LESSON: *Climbed to the 12h cluster but held for the 24h (never reached) -> round-trip, +0.58R instead of ~+3.4R. Bank at the 12h cluster, ALWAYS. L69.*

#78 EVAA LONG B+ -1R

Perp-only with no spot: DATA GO but reversal-prone. Topped at 1.10, never 1.20, flushed through the SL. Clean execution, wrong thesis · 13/07/2026 · Leverage 5x

LOSS

📊 Context

GO base: CVD +307k burst aligned, OI +12%/5 candles, short liqs live, decoupled from BTC. Earned entry at the higher low at ~4R

The caveat: soft contrarian crowd 55% + perp-only / zero spot = reversal-prone (said at entry)

Outcome: topped 1.10 (never 1.20), flip confirmed, flushed through the SL. Exit 0.9236, -1R net

💡 Thesis

Shrimp EVAA, DATA GO (CVD burst, OI +12%, short liqs, decoupled from BTC), earned entry at the higher low at 4R toward the 1.228 cluster. Caveat accepted: perp-only, zero spot = reversal-prone.

🎯 Plan

Entry 0.9874 (limit on pullback, no chasing the +14%/1h vertical), SL 0.9285 (Mark price), TP cluster 1.228. Target R:R +4.08R.

🔍 Post-trade review

The perp-only with no spot topped at 1.10, never 1.20. Absorption defended the SL twice, then flip confirmed (CVD rolling over -54k + crowd 58->53%) = flush. SL hit at 0.9236 in the flush. R -1, net -$138.63.

✅ Strengths

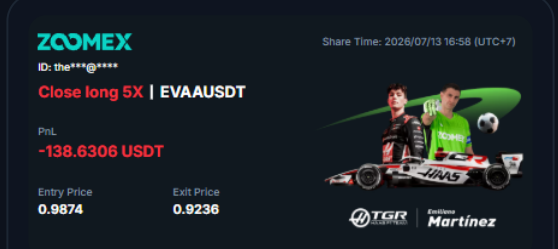

- EARNED entry at the higher low at ~4R, no chasing the vertical
- SL on Mark price filtered 2 last-price wicks before the real flush
- Clean process: SL never widened, zero adds, -1R accepted net

⚠️ Weaknesses

- Perp-only thesis with no spot = reversal-prone (caveat seen but taken anyway)
- SL jammed at 0.9285 above the real swing 0.9136 (L29/L64)
- Soft contrarian crowd (55% short) = weak contrarian fuel

ENTRY	EXIT	STOP	LOSS
0.9874	0.9236	0.9285	-138.63 USDT

> **LESSON:** *Perp-only with no spot = reversal-prone: topped 1.10, never 1.20. Caveat seen, taken anyway. SL below the real swing, not jammed. Clean execution, wrong thesis.*

#79 MAGMA LONG B

-1R

LOSS

Clean plan (SL not jammed, cluster TP, R:R 4.64) but a base with NO trigger (soft CVD, perp-only): coin-flip lost · 13/07/2026 · Leverage 10x

📊 Context

Partial base: crowd 61% short (contrarian) + decorrelated from BTC, BUT soft/drifting CVD, never a burst (missing trigger) + perp-only

The read: 'lukewarm hand, the most likely to hit the SL' (the other = RE, spot-backed = strong)

Outcome: never any ignition, flip confirmed (CVD -41k + OI bleed) -> SL. Exit 0.34286, -1R net

💡 Thesis

Crowd 61% short + decorrelated, but soft/drifting CVD with never a burst + perp-only = no trigger, no real edge. The plan was clean, the entry was not.

🎯 Plan

Entry 0.3499 (limit on pullback), SL 0.34341 (NOT jammed, below the swing = EVAA lesson), TP 0.37999 (yellow cluster 0.38). R:R 4.64, shrimp ~6.7k notional.

🔍 Post-trade review

Never any ignition (CVD drifting, no burst at all). The flip confirmed (CVD -41k + OI bleed -1.8% + swing low break) -> SL 0.34341. TP 0.38 never came close. R -1, net -$144.88.

✅ Strengths

- SL NOT jammed this time (below the swing, EVAA lesson applied)
- Clean plan: TP at the cluster, R:R 4.64, shrimp size = tiny loss
- Binary management respected, zero premature puke

⚠️ Weaknesses

- Entry on a LUKEWARM hand: soft CVD, never a burst = no trigger
- Perp-only / no spot = no support, coin-flip
- The bot pinged premium but the manual read already said lean SKIP

ENTRY	EXIT	STOP	LOSS
0.3499	0.34286	0.34341	-144.88 USDT

> **LESSON:** *A base without a trigger (CVD burst) = weak hand, not a GO. Spotless plan but lukewarm entry + perp-only = coin-flip lost. The flaw = the entry, not the stop.*

#80 RE LONG B+ -1R

Strong hand, a strong GO that loses = normal (WR 46%). Checked afterwards: the tight SL was the right one · 13/07/2026 · Leverage 10x LOSS

📊 Context

Complete GO base: CVD +120k BURST, crowd 68% short (contrarian), spot-backed, decorrelated. The best GO of the day

The flaw: tight SL at 0.5343 (0.89%), TP 12h cluster 0.562, R:R 4.77

Outcome: drift then break of the SL, out at 0.5334. Price then went down to 0.5208. -1R

💡 Thesis

RE = the strong hand of the evening, RIGHT entry (all pillars). A strong GO that loses = normal (WR 46%). No execution error: variance in a BTC with no volatility. The tight SL was the right one.

🎯 Plan

Entry 0.5391 (fill is sacred), SL 0.5343 (tight, below the swing but above the ATR 0.5318), TP 0.562 (12h cluster). R:R 4.77.

🔍 Post-trade review

+0.56R at the peak, then drift and wick through the SL. Low 0.5330: price then went down to 0.5208, a wider stop would have lost more. Tight SL = the right one. R -1, net -$155.20.

✅ Strengths

- RIGHT entry: strong hand, complete GO base (burst + spot + crowd)
- The best actionable GO of the day
- Zero premature puke, binary management respected

⚠️ Weaknesses

- Loss = the no-volatility BTC regime, not the analysis nor the SL
- The move lacked follow-through despite the spot (flat BTC regime)
- 3rd loss in a row = variance on a strong hand

ENTRY	EXIT	STOP	LOSS
0.5391	0.5334	0.5343	-155.20 USDT

> **LESSON:** *A strong GO that loses = normal (WR 46%). But a tight SL below the ATR level = wick-risk: here the low never touched the ATR, price plunged well below the stop, a wider SL would have lost more. The tight SL was the right one.*

#81 1000RATS LONG B -1R

Perp-only: climbed to +1.9R then full round-trip. The tight SL capped the loss, price plunged below both possible stops · 14/07/2026 · Leverage 10x LOSS

📊 Context

The ping: premium coil, crowd 76% short (contrarian), BUT perp-only (zero spot) and funding +0.04 (longs pay)

How it went: climbed to +1.9R (0.03641) then full round-trip = perp-only reversal

Outcome: SL 0.03534 hit, out at 0.03524. R -1 (actual -1.34R), net -$165.59

💡 Thesis

Contrarian coil toward the 0.03748 cluster (R:R 4.22), BUT perp-only and positive funding = squeeze with no spot fuel. Weak hand in a flat BTC.

🎯 Plan

Entry 0.03575 (pullback), tight SL 0.03534 (1.15%), TP 12h yellow cluster 0.03748. R:R 4.22.

🔍 Post-trade review

The burst climbed to +1.9R then evaporated (perp with no spot) = round-trip to the SL. Actual low 0.03496 BELOW both possible SLs: the tight SL capped it, a wider stop would have lost more. R -1, net -$165.59.

✅ Strengths

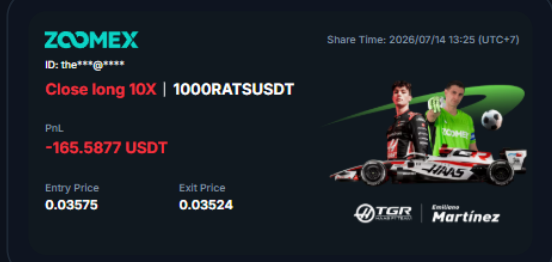

- The tight SL capped the loss (price plunged below both stops)
- Crowd 76% short (contrarian) toward a clear cluster (R:R 4.22)
- Cut clean at the SL, zero averaging down

⚠️ Weaknesses

- Perp-only (zero spot): a burst without spot reverses
- Funding +0.04 (longs pay) = not a real squeeze
- Entry in a BTC with no volatility = no fuel

ENTRY	EXIT	STOP	LOSS
0.03575	0.03524	0.03534	-165.59 USDT

> **LESSON:** *Perp-only + positive funding = squeeze with no fuel: it climbs then round-trips. And the tight SL was right, price plunged below both possible stops.*

#82 MAGMA LONG A

+4.90R

WIN

The contrarian coil that breaks THE streak: tight range, crowd short, CVD buying, spring toward the cluster. +4.9R that wipes out 5 losses · 15/07/2026 · Leverage 10x

📊 Context

The ping: premium shrimp coil, crowd 63% short (contrarian), CVD +64k buying, RSI 1h 32 (room)

The plan: entry 0.26064 inside the range, SL 0.25732 below the range, TP cluster 0.27756. R:R ~5

How it went: the coiled range breaks to the upside, runs all the way to the cluster. Out at 0.27660 = +4.90R

💡 Thesis

Crowd short + compressed spring (coil) + CVD buying toward a clear cluster = the textbook contrarian setup. The tight range breaks to the upside and squeezes the shorts.

🎯 Plan

Entry 0.26064 (range), SL 0.25732 (below the range, 1.27%), TP cluster 0.27756. R:R ~5.

🔍 Post-trade review

The coil held, the short crowd got squeezed, price ran all the way to the cluster. Out at 0.27660, +4.90R, +$596.48. MAGMA = perp-only (no spot), proof that perp-only is not a veto: here it delivered.

✅ Strengths

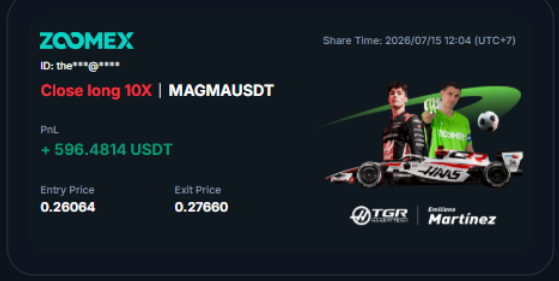

- Clean base: crowd 63% short (contrarian) + CVD buying + coil
- SL below the range (structural), R:R ~5 toward a clear cluster
- Full ride to the cluster, binary doctrine respected

⚠️ Weaknesses

- Perp-only (no spot): won here, but still to be watched
- RSI 1h 32 = falling-knife risk accepted at entry
- Thin coin (shrimp), data verified on few exchanges

ENTRY	EXIT	STOP	WIN
0.26064	0.2766	0.25732	+596.48 USDT

> **LESSON:** *One +4.9R pays for 5 losses of -1R: that is the whole point of aiming big. Crowd short + coil + CVD buying toward a cluster, and the streak breaks.*

#83 KITE LONG A

+2.60R

Morning WATCH turned into a clean GO: range breakout on a 4/4 base, entry on the retest, no chase. +2.60R net · 15/07/2026 · 10x

WIN

📊 Context

The ping: premium shrimp, crowd 63% short, CVD buying, OI +3.9%, spot-backed, decoupled from BTC

The plan: do not chase the pop, wait for a range breakout that holds, enter on the retest

How it went: the range breaks, retest holds, entry 0.12139. Exit in profit 0.1238 = +2.60R

💡 Thesis

Crowd 63% short + CVD buying + OI expanding + spot-backed, under a clear range ceiling: the contrarian setup. The breakout squeezes the shorts toward the 12h cluster.

🎯 Plan

Do not chase the pop (into resistance). Wait for the breakout of the 0.12283 range to hold, enter on the retest. SL 0.11856 below the structure.

🔍 Post-trade review

WATCH converted cleanly: breakout confirmed on a 4/4 base, PATIENT entry on the retest (no chase), healthy SL below the structure. Exit in profit 0.1238 (Zoomex split it into 2 fills), +$331.41 net. The 12h cluster 0.13247 was not reached: possibly an early cut.

✅ Strengths

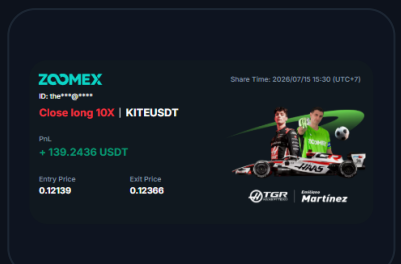

- WATCH turned into a disciplined GO: 4/4 base, no chase
- Patient entry on the retest, SL below the structure
- Shrimp handled well: small size, thin order book

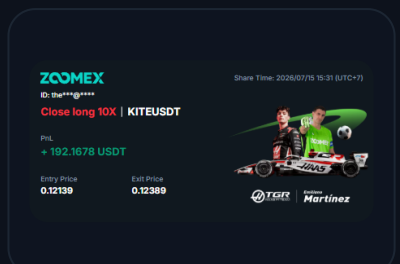

⚠️ Weaknesses

- Early exit? 0.1238 vs 12h cluster 0.13247
- THIN order book (shrimp): size constrained, slippage risk
- Thin coin, data on few exchanges

ENTRY	EXIT	STOP	WIN
0.12139	0.1238	0.11856	+331.41 USDT

> **LESSON:** *It is the execution that pays, not the coin: a WATCH becomes a GO through discipline (4/4 base, retest not chase, SL below the structure).*

#84 VVV LONG B+ -1R

The cleanest setup of the evening, killed by its one caveat: NO spot pair. Classic perp-only reversal. -1R net · 15/07/2026 · 10x LOSS

📊 Context

The ping: premium, crowd 68% short, CVD burst +57k, OI expanding, order book bid-heavy 2x, favorable heatmap

The caveat: NO spot pair = spot-backing unverifiable (the filter of the day) + correlated to a hot BTC (RSI 72)

How it went: pop to 11.07 (+0.66R) then full round-trip down to the SL 10.863. No-spot reversal

💡 Thesis

Very clean contrarian base (68% short + CVD burst + OI + bid-heavy order book) under clear clusters. The only hole: no spot pair to verify that the demand is real and durable.

🎯 Plan

Entry 10.997 on pullback, SL 10.863 below the structure (clean, not jammed), TP 11.699. R:R ~5.2R. Binary ride.

🔍 Post-trade review

The best base of the evening, but no-spot was THE right read: pop to 11.07 then gave it all back down to the SL. Classic perp-only reversal (like 1000RATS/EVAA). A perfect base does not make up for the absence of spot-backing: spot tells you whether a move HOLDS. Clean execution (SL below structure, binary): the flaw = the entry (no-spot + hot BTC).

✅ Strengths

- Very clean base: 68% short + CVD burst + OI + bid-heavy book
- SL below the structure (not jammed), binary respected
- no-spot correctly identified as THE caveat before entry

⚠️ Weaknesses

- NO spot pair = spot-backing unverifiable (fatal here)
- Correlated to BTC +0.40 with a hot BTC (RSI 72)
- CVD burst already cooled off at entry (+57k -> -2k)

ENTRY	EXIT	STOP	LOSS
10.997	10.8484	10.863	-149.95 USDT

> **LESSON:** *A perfect base does not make up for the absence of spot-backing: without a spot pair, the perp-only move reverses. Spot tells you whether it HOLDS, not the size of the CVD burst.*

#85 ALLO LONG A -1R

Clean L78 base and spotless execution, killed by a -1.71% BTC dump. The SL was tighter than the macro noise. -1R net · 16/07/2026 · 10x

LOSS

📊 Context

The base: bullish spot-backed +13k (accumulation), crowd 63% short, CVD aligned +85k, OI expanding, decoupled from BTC

The execution: patient limit 0.40008 on a dip, SL 0.39441 below the swing low, TP 0.41999 at the 12h cluster, R:R 3.51

The shock: BTC dump -1.71% (64,997 to 63,888) dragging the alts. SL hit mechanically

💡 Thesis

Valid L78 pattern: spot accumulating (+13k) under a coiled range, crowd 63% short, CVD following. Target = the biggest 12h yellow cluster at 0.41999, R:R 3.51.

🎯 Plan

Limit entry 0.40008 on a dip (zero chase), SL 0.39441 below the swing low 0.39692, TP 0.41999 at the cluster. Binary ride.

🔍 Post-trade review

The base was REAL and the execution clean from start to finish. A -1.71% BTC dump dragged the alts. It was NOT foreseeable: at entry, BTC was -0.25% from its high, 45 min after a pump. The real lesson is elsewhere: the SL at -1.42% was TIGHTER than routine macro noise, so it gets hit mechanically whatever the setup. The 3.51R rested on an SL sitting inside the noise.

✅ Strengths

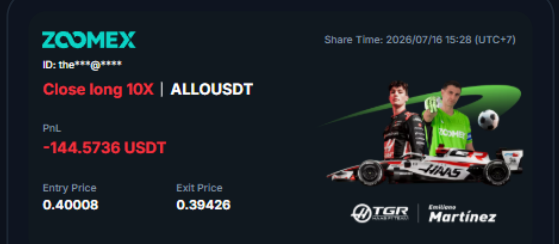

- L78 base verified: spot-backed +13k, 63% short, CVD aligned
- Patient limit entry on a dip, zero chase
- Structural SL below the swing low, TP at the real 12h cluster

⚠️ Weaknesses

- SL -1.42% tighter than the BTC macro noise (-1.71%)
- R:R 3.51 illusory because it rested on an SL inside the noise
- Exit slipped below the SL (thin shrimp order book)

ENTRY	EXIT	STOP	LOSS
0.40008	0.39426	0.39441	-144.57 USDT

> **LESSON:** *An SL tighter than the macro noise gets hit mechanically, whatever the setup. Check that the stop sits OUTSIDE the macro noise before selling yourself a pretty R:R.*

#86 DEXE LONG A+

-1R

LOSS

The best foundation of the day, climbs to +2.2R, then a full round-trip down to the SL. Nothing to fix: variance. -1R net · 16/07/2026 · 10x

📊 Context

The foundation: spot-backed +2.55M x1.9, crowd 75% short and trapped, perp CVD flips to buyers, short liqs cascading

The execution: conditional breakout 35.054 (zero chase), SL 34.038 below the HL, TP 39.55 at the real 12h cluster, R:R 4.03

How it played out: climbs to 37.5 (+2.2R, 55% of the way) then gives it all back down to the SL around 20:00

💡 Thesis

The best foundation in days: spot accumulating (+2.55M x1.9), crowd 75% short and trapped, perp CVD flipping to buyers, short liqs cascading. Target = the biggest 12h cluster at 39.55.

🎯 Plan

Entry on conditional breakout 35.054 (fill 35.1328), SL 34.038 below the HL of the bounce, TP 39.55 at the cluster. Binary ride, zero partials.

🔍 Post-trade review

Everything was right: the foundation (the best of the day), the entry (conditional, zero chase), the structural SL, the TP at the real cluster. Climbed to +2.2R then gave it all back. Spot was STILL buying at 20:44 (+878k) while price was hunting the SL: spot tells you whether a move HOLDS, not WHEN. The bot's flip came AFTER the SL. Nothing to fix: variance.

✅ Strengths

- The best foundation of the day: spot +2.55M, 75% short, CVD flipped
- Entry on conditional breakout, zero chase
- Structural SL below the HL, TP at the real 12h cluster

⚠️ Weaknesses

- Round-trip from +2.2R to -1R: the accepted cost of binary management
- Spot-backing does not tell you the TIMING (it was buying at the SL)
- Exit slipped below the SL (thin order book)

ENTRY	EXIT	STOP	LOSS
35.1328	34.0037	34.038	-146.77 USDT

LESSON: *The best foundation of the day lost. Spot tells you whether a move HOLDS, not WHEN. And the bot's flip came AFTER the SL: the stop protected better.*

#87 BANK LONG B+

-1R

LOSS

Tight stop accepted to hold 4.13R, swept in 6 minutes. -1R net · 18/07/2026 · 10x

📊 Context

The foundation: spot-backed +254k x1.2, CVD +275k, OI +3.0%, crowd 56% short, decoupled from BTC

The execution: limit maker 0.07076 with no slippage, SL 0.06828 below the swing, TP 0.08101 at the cluster

How it played out: filled at 14:15, stop hit at 14:21: 6 minutes, no decision to make

💡 Thesis

Spot is buying back the morning's -18% crash (+254k x1.2), crowd 56% short, CVD and OI rising. Target = the heatmap magnet at 0.08101.

🎯 Plan

Patient limit entry at 0.07076, SL 0.06828 below the 0.07108 swing, TP 0.08101 at the cluster. R:R 4.13. Binary ride, zero partials.

🔍 Post-trade review

Flawless execution: maker entry with no slippage, SL below the swing, TP as a real limit order, sizing at exactly 1.000R. The problem was quantified BEFORE entering: ATR 5.94% against a 3.50% stop, that is 0.59 ATR. Below the swing, yes, but the swing was only 0.7% from price. The choice was explicit: structural stop and 2.12R, or tight stop and 4.13R.

✅ Strengths

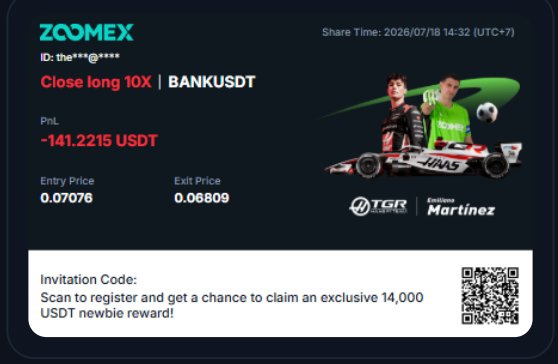

- Maker entry with zero slippage, sizing at exactly 1.000R
- TP as a real limit order at the cluster, verified via the API
- The stop-versus-3R trade-off was quantified before the entry

⚠️ Weaknesses

- Stop at 0.59 ATR on a coin that had just done -18%
- Entry against a 4h counter-trend of -9.86%
- Exit slipped 0.27% below the stop, across 113 fills

ENTRY	EXIT	STOP	LOSS
0.07076	0.06809524	0.06828	-141.22 USDT

> **LESSON:** *Being below the swing is not enough: if the swing sits in the noise, so does the stop. The two tests, structure and ATR width, are independent.*

+3.54R

WIN

Limit entry placed 2.37% below market, TP at the dominant cluster hit in 42 minutes. +3.54R net · 18/07/2026 · 10x

📊 Context

The foundation: spot-backed +117k, CVD +254k, OI +3.1%, crowd 63% short, 4h +10.6%

The execution: limit 2.37% below market (zero chase), SL below the swing, TP at the real magnet 0.43999

How it played out: filled at 16:02, TP hit at 16:45: 42 minutes, binary held, no intervention

💡 Thesis

Spot is going along (+117k), crowd 63% short, CVD accelerating (+195k over 4 bars), OI expanding. Target = the dominant magnet at 0.43999.

🎯 Plan

Patient limit entry 2.37% below market at 0.41477, SL 0.40774 below the swing, TP 0.43999 at the cluster. R:R 3.59. Binary ride.

🔍 Post-trade review

Patience makes the trade: the limit is placed 2.37% below market instead of chasing, and that is what delivers the 3.59R. The reservations (15m RSI 71.5, no swing high above) were noted before entering. Three proofs land here: the TP EXECUTES as a limit (fix L91 proven), it fills 0.0003% ABOVE the target, and Partial mode does close 100%.

✅ Strengths

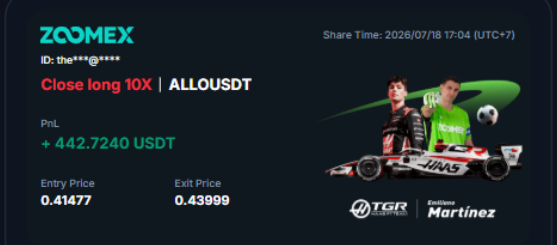

- Limit entry 2.37% below market: zero chase
- TP at the real magnet, filled 0.0003% above
- Binary held: no partials, no intervention

⚠️ Weaknesses

- 15m RSI at 71.5, overheated at entry, accepted
- No reference swing high above (new highs)
- Modest spot foundation (+117k) given the targeted R:R

ENTRY	EXIT	STOP	WIN
0.41477	0.43999134	0.40774	+442.72 USDT

> **LESSON:** *Patience at the entry IS the R:R: placing the limit 2.37% below market instead of chasing is what delivers the 3.59R.*

#89 US LONG B+

+2.19R

Went down to -0.79R, never cut on the pain, came back to +2.19R. +2.19R net · 18/07/2026 · 10x

WIN

📊 Context

The foundation: the strongest contra-crowd of the day (66% retail, 70% big accounts), CVD flipped

The execution: limit maker 0.045052 (zero slippage), SL 0.043307, TP 0.0537 as a real order

How it played out: -0.79R at 13:34, HOLD on the data, +0.88R at 16:50, manual exit at +2.19R

💡 Thesis

The crowd is massively short (66% retail, 70% of big accounts) and the CVD flips from -35k to +70k: the trigger is there. Target = 0.0537.

🎯 Plan

Limit entry 0.045052, SL 0.043307 below the swing, TP 0.0537 at the cluster. R:R 4.96. Binary ride.

🔍 Post-trade review

The trade is decided at 13:34, at -0.79R, when it stings. The flip combo is at 0-1/4 (bid-heavy book, positive CVD, crowd still short): the data says HOLD, we hold, price bounces. Cutting there would have turned this +2.19R into a loss. The exit, though, was NOT a data signal: a personal obligation, Alan owns it. The outcome was favorable but it does not validate the process. Keep in mind: SL and TP were armed, the position needed no monitoring at all.

✅ Strengths

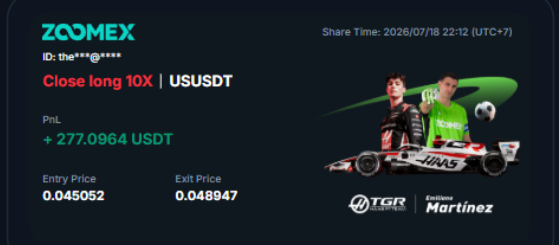

- At -0.79R, HOLD decided on the data and not on the pain
- Strongest contra-crowd of the day, CVD flipped = real trigger
- Maker entry with zero slippage, SL and TP armed as real orders

⚠️ Weaknesses

- No spot pair: durability impossible to verify
- Entry against a 4h counter-trend of -7.9%
- Exit not triggered by the data, favorable outcome by luck

ENTRY	EXIT	STOP	WIN
0.045052	0.04894761	0.043307	+277.10 USDT

> **LESSON:** *The trade is won at -0.79R: holding because the data says hold. But an exit that works by luck does not become a method.*

+2.11R

GO on green data that HOLDS. ~1h underwater (SL intact), +2R once BTC held. Manual exit before the TP, to be reviewed. +2.11R net · 21/07/2026 · 10x

WIN

📊 Context

The foundation: spot-backed +166k x1.1, 4-bar CVD +92k, crowd 64% short, decoupled from BTC

The execution: limit 0.3714 below market, SL 0.3664 (~1 ATR), TP at the 12h cluster 0.3919

How it played out: filled on the rejection of the BTC high, ~1h underwater, +2R once BTC holds

💡 Thesis

Green data that HOLDS: durable spot +166k x1.1, crowd 64% short, 4-bar CVD +92k. GO after a re-challenge (in the morning, too anchored on the M2 magnet below price).

🎯 Plan

Limit entry 0.3714 below market, SL 0.3664 below the swing, TP 0.3919 at the 12h cluster. Binary ride.

🔍 Post-trade review

Filled on the rejection of the BTC high. ~1h underwater (SL intact) -> HOLD on the data (spot buying, contra 64%, OI flat). BTC holds, RE takes off again to +2R. MANUAL exit before the TP (fear of a post-cluster rejection), to be reviewed with a cool head.

✅ Strengths

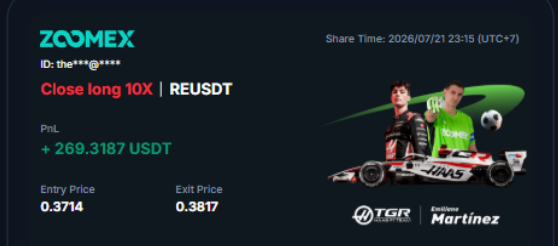

- Green data that HOLDS: spot +166k, CVD +92k, contra 64%
- HOLD on the data while underwater, SL never hit
- Limit entry below market, zero chase

⚠️ Weaknesses

- M2 magnet below price (RE's SL in the morning)
- Entry on a BTC-dependent thesis
- Manual exit before the TP: to be reviewed

ENTRY	EXIT	STOP	WIN
0.3714	0.38173107	0.3664	+269.32 USDT

> **LESSON:** *Green data that HOLDS + HOLD on the data (not the pain) = +2R. The manual exit before the cluster TP still needs a cool-headed review.*

#91 VANRY LONG B

-1R

LOSS

Excellent data, botched entry: SL too tight, wicked out in the noise. Full loss -1R · 22/07/2026 · Leverage 10x

📊 Context

The foundation: extreme funding -0.20%, 65% short, spot-backed, OI expanding: real squeeze, 0.005 cluster intact at +5%

The problem: clean pullback (0.004705, 3.3R) missed; market entry 0.004830, SL at 0.89 ATR to show 3R

How it played out: stopped out in ~4 min, wicked at 0.004765, without the thesis breaking

💡 Thesis

The squeeze was real and the 0.005 cluster intact at +5%: the data said long. But the clean entry had already passed.

🎯 Plan

Having missed the pullback at 0.004705, market entry 0.004830, SL 0.004776 (0.89 ATR) to keep a displayed 3R.

🔍 Post-trade review

An SL at 0.89 ATR sits in the noise: on a vertical +5%, a one-ATR breather wicks the stop (actual low 0.004765) without breaking the thesis. The same trade from 0.004705 would have survived. The loss comes from the stop, not from the data.

✅ Strengths

- Correct data read: real squeeze, cluster intact
- Sizing at exactly 1R: risk kept in check
- Order cut without stubbornly pushing on

⚠️ Weaknesses

- Clean pullback at 0.004705 not waited for
- SL at 0.89 ATR: in the noise, fake 3R
- Late entry on the approach to the cluster

ENTRY	EXIT	STOP	LOSS
0.00483	0.0047688	0.004776	-160.00 USDT

Futures	Qty	Entry Price	Exit Price	Closeout P&L (including commission)
VANRYUSDT Close long	-384,472	0.004830	0.004770	-24.2834
VANRYUSDT Close long	-1,050,000	0.004830	0.004767	-69.1300
VANRYUSDT Close long	-1,050,000	0.004830	0.004770	-66.5936

> **LESSON:** *Strong data + clean entry missed: wait for the price that gives 3R back with a survivable SL, never tighten the stop for the number.*

LOSS

The best GO of the evening, lost on its only reservation (perp-only, reversal-prone). Profit then a slow fade down to the SL. -1R net · 22/07/2026 · 10x

📊 Context

The foundation: 3 green pillars: contra 67-68% + smart 72%, CVD +63k, OI +2.5%, SL below swing

The execution: MARKET 0.045601, SL 0.044519, TP 0.049850, R:R 3.9R

How it played out: filled in profit, slow overnight fade down to the SL around 03:00

💡 Thesis

The best 3-pillar GO of the evening: SL below the swing, the strongest contra of the batch (67-68% short, CVD +63k, OI +2.5%), R:R 3.9R towards the 0.050 magnet. Single reservation: perp-only, no spot backing.

🎯 Plan

MARKET 0.045601 (fill is sacred), SL 0.044519, TP 0.049850 at the M2 cluster. Binary ride.

🔍 Post-trade review

In profit at 23:10, then a slow overnight fade down to the SL. Binary held: SL+TP armed, zero monitoring, no panic. The reservation materialized: a contra-crowd without durable spot reverses. No execution or management error, variance did its thing.

✅ Strengths

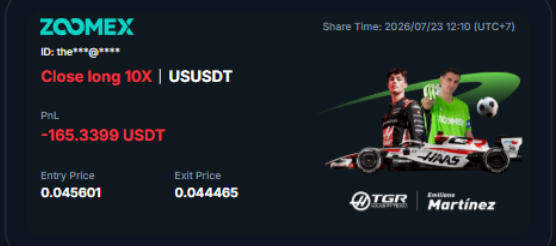

- Strongest contra of the batch + CVD +63k + R:R 3.9R
- Disciplined entry: fill is sacred
- Binary held: SL+TP armed

⚠️ Weaknesses

- Perp-only: reversal-prone (the reservation that materialized)
- Contra-crowd that reverses overnight
- Slight oversize: 1.07R

ENTRY	EXIT	STOP	LOSS
0.045601	0.044465	0.044519	-165.34 USDT

> **LESSON:** *The best 3-pillar GO of the evening can lose on its only reservation (perp-only). Correct process, variance against.*

CLOSING OF VOLUME 1

End of the manual era, the challenge goes on

92 trades, 48 days. From 5 June to 22 July 2026, every trade in this document was analyzed, decided and executed by hand: reading the data, the GO, the sizing, the management, all of it.

This chapter closes here, on a deliberate choice. The strategy you have just read is now executed by a **bot**, built trade after trade from these 92 lessons. Same data, same rules, same 1R risk management, but with no fatigue, no FOMO, no sleepless nights.

The challenge itself does not stop: the capital and the counter pick up exactly where this page leaves them. Trades **#93 and onwards** are being written automatically, in real time.
